

Protecting the Sovereign’s Money Monopoly

Gary B. Gorton & Jeffery Y. Zhang*

November 11, 2022

Abstract

Sovereign states have had a monopoly over the production of circulating money for well over a century. Governments, not private entities, issue circulating money. The advent of stablecoins—privately issued digital money that can circulate—raises the question of the sovereign’s money monopoly from the grave. Should private money circulate alongside sovereign money in the 21st century? We argue against coexistence to preserve financial stability and monetary sovereignty.

Through the lens of economic theory, we explore the coexistence question by revisiting the original debates that led to the sovereign’s money monopoly in England, the United States, Canada, and Sweden. In each case, private money first circulated because of a limited money supply—namely, a shortage of specie—and because there were no better alternatives. However, after the development of modern central banking and sovereign fiat money, the circulation of private money was banned to improve financial stability and gain greater control over the money supply. Notably, in the United States, Congress enacted a 10 percent tax on the circulation of private money in 1865 that stayed on the books until 1976, when Congress decided to streamline the Internal Revenue Code by deleting provisions deemed “obsolete” or “unimportant and rarely used” from a tax perspective.

Today, lawmakers assume that coexistence is the optimal path forward and are crafting legal guardrails under that assumption. We argue that lawmakers should instead seek to maintain the government’s monopoly by creating a better sovereign alternative in the form of a central bank digital currency (the carrot) and deterring the adoption of stablecoins through a ban or a tax (the stick).

Introduction

During the 19th and 20th centuries, every country decided that the production of circulating money would be a monopoly given to the sovereign, particularly to the country's central bank. Milton Friedman and Anna Schwartz—two of the most prominent monetary economists in history—concluded that “[t]he question of government monopoly of hand-to-hand currency is likely to remain a largely dead issue.”¹ But the issue has come alive today with the advent of stablecoins,² which are a subset of cryptocurrencies.

Unlike Bitcoin and Ethereum—cryptocurrencies whose prices are highly volatile because they are backed by nothing—stablecoins are backed by safe assets so they can “trade at par.” For example, some stablecoins are backed by U.S.-dollar-denominated assets so that each stablecoin can be redeemed for one U.S. dollar. Given this ability to trade at par, stablecoin issuers assert that consumers can one day use stablecoins (in their digital wallets) to buy groceries or pay for gas in the same way that consumers today use cash (in their physical wallets) to buy groceries or pay for gas. Stablecoins are created as a form of circulating money, a digital version of cash.

There are two fundamental questions regarding stablecoins from the perspective of financial regulation. First, what exactly are stablecoin issuers? Second, should private stablecoins coexist with sovereign money? In *Taming Wildcat Stablecoins*, we argue that stablecoin issuers are economically equivalent to unregulated banks. Like banks, stablecoin issuers produce short-term debt but in the form of digital tokens. These issuers therefore suffer from run risk and have the potential to generate systemic dangers in the financial system.³ The President's Working Group on Financial Markets, led by the U.S. Department of the Treasury, agreed with this characterization in their *Report on Stablecoins* that was issued in November 2021.⁴

⁴ See President's Working Group on Financial Markets, *Report on Stablecoins* at 2 (2021) (“To address risks to stablecoin users and guard against stablecoin runs, legislation should require stablecoin issuers to be insured depository institutions...”). The *Report* was the result of a collaborative effort by the

This article now addresses the second question of coexistence, which has not received as much attention but is arguably even more important because it implicates monetary sovereignty in addition to financial stability.

Today, members of Congress and senior policymakers are of the view that coexistence is possible and desirable. For example, Senator Pat Toomey is seeking to create a regulatory framework for stablecoins that “will allow this crypto-innovation to continue flourishing while protecting consumers and minimizing potential risks from stablecoins to the financial system.”⁵ Federal Reserve Chair Jerome Powell took the coexistence view during his confirmation hearings, saying that private stablecoins could compete with sovereign digital money (otherwise known as a central bank digital currency, or a “CBDC” for short).⁶ Federal Reserve Vice Chair Lael Brainard, in a speech at the 2022 Monetary Policy Forum in New York, stated that “the coexistence of CBDC alongside stablecoins and commercial bank money could prove complementary, by providing a safe central bank liability in the digital financial ecosystem, much like cash currently coexists with commercial bank money.”⁷

The notion of coexistence is also widespread among the academic community. Indeed, the vast majority of academic scholarship on this topic has advocated for well-regulated coexistence.⁸ But this idea of coexistence between private and sovereign circulating monies has been tried in the past and was rejected—and for good reasons.

Our article proceeds as follows: In Part I, we distinguish between different types of money in the modern financial system to advance the debate. Table 1 presents a snapshot of our taxonomy. On the horizontal axis, we divide money into “private money” and “sovereign money” based on the economics literature. Private money is a claim where issuer (obligor) is a private firm, and sovereign money is a claim where the federal government is either the issuer or the guarantor.⁹ On the vertical axis, we split money into “token-based” (*i.e.*, circulating) money and “account-based” (*i.e.*, non-circulating) money.¹⁰ There is, of course, coexistence between account-based sovereign and private money. But the same is not true for circulating money—certainly not at scale—and has not been true for well over a century. Thus, when we speak of “coexistence” in this article, we are referring to coexistence between private and sovereign forms of token-based, circulating money. We end Part I with a discussion of why coexistence presents a serious problem to financial stability and monetary sovereignty from an economics perspective.

Table 1: Examples of Different Types of Money

	Private Money	Sovereign Money
Token-Based Money	Stablecoins	Cash
Account-Based Money	Money Market Funds	Insured Bank Deposits

In Parts II and III, we leverage financial history to support the economic analysis in Part I. Part II revisits a few historical instances in the 18th and 19th centuries when private money circulated. The key takeaway is that private money circulated when *there were no better alternatives*—specifically, when there was a shortage of metal coins issued by the sovereign. Part III turns to case studies of the transition from

Economics of Stablecoins SSRN Working Paper (2020). *But see* Hilary J. Allen, *\$=€=Bitcoin?*, 76 Maryland Law Review 877 (2017) (arguing that “the best way to contain [cryptocurrency] risks is for regulated institutions to outcompete virtual currencies by offering better payment services, thus consigning virtual currencies to a niche role in the economy”).

⁹ See Morgan Ricks, *THE MONEY PROBLEM: RETHINKING FINANCIAL REGULATION* (2016) at 32-34 (analyzing the contemporary monetary landscape and distinguishing private money from sovereign money). To be sure, sovereignty exists on a spectrum. It is not zero or one. Our presentation of “private” versus “sovereign” in this 2x2 matrix is meant to be an illustration.

¹⁰ Another way to think of circulating, token-based money is as a “bearer instrument.” A bearer instrument refers to an instrument that is payable to anyone possessing the instrument and is negotiable by transfer alone. The transaction history of the instrument does not matter.

coexistence to the sovereign's monopoly in England, the United States, Canada, and Sweden.¹¹

In Part IV, we first present the current legislative proposals for coexistence and then challenge their desirability. Based on economic theory and financial history, the most compelling reason for sovereign states to possess a monopoly over circulating money was *financial stability*. The issuers of circulating private money were vulnerable to runs; credible sovereign money alleviated this risk. The same vulnerability exists today with respect to the circulation of stablecoins. Our financial regulatory framework is geared toward accounted-based private money and is not well-suited to address the risks associated with circulating private money.

Another consideration was *monetary sovereignty*, which has implications for control over the money supply. Paul Tucker, a former deputy governor of the Bank of England, once offered the most succinct statement of the dominant approach to monetary operations: “We are able to implement monetary policy because the economy has a demand for central bank money and, *as monopoly suppliers*, we can set the terms on which we provide it.”¹² This power would be diluted if private stablecoins circulated widely as a competitor to sovereign money. While financial stability risks are common to account-based private money and token-based private money, this monetary sovereignty concern is unique to the latter.

In Part V, we propose a different path forward. We argue that Congress should instead preserve the government's monopoly by creating a better sovereign alternative in the form of a central bank digital currency (the carrot) and deterring the adoption of stablecoins through either a ban or a tax (the stick). The carrot is essential because there is global demand for private stablecoins, and Congress cannot simply legislative away a transnational issue. Providing a better alternative to private stablecoins would directly confront the underlying demand for such a monetary instrument. However, as history has shown, a deterrent is also needed. In the United States, the road to the sovereign's money monopoly began during the Civil War when Congress passed the National Bank Act in 1863 to help finance the war by creating national banks to issue a uniform national currency. Adoption of the new national currency was not immediate. To incentivize uptake, Congress repeatedly passed legislation over the next decade that taxed transactions made in currencies other than the national

¹¹ These historical case studies are not intended to be a comprehensive treatment of the history of money. They are a subset of that history, focused on the circulation of bank notes. For an exploration of prior periods and other forms of circulating money, *see, e.g.*, Christine Desan, *MAKING MONEY: COIN, CURRENCY, AND THE COMING OF CAPITALISM* (2015).

¹² Paul Tucker, *The Central Bank's Balance Sheet: Where Monetary Policy Meets Financial Stability*, Speech to Mark the Fifteenth Anniversary of Lombard Street Research (2014) (emphasis added).

currency. This carrot-and-stick approach would ensure that the government preserves its monopoly over money and would mitigate the substantial risks to financial stability and monetary sovereignty.

Part I. Overview of the Different Types of Money

In this Part I, we first seek to clarify terminology to advance the discussion. We present an economic theory on what makes an instrument money in a modern market economy, and then we provide a taxonomy of the different types of money that exist today. This taxonomy is important because many believe that private money and sovereign money have always coexisted, but that depends crucially on the type of money being discussed. Account-based private money (*e.g.*, money market funds) and account-based sovereign money (*e.g.*, FDIC insured bank deposits) have indeed coexisted, but the same is not true of circulating private money and circulating sovereign money. We conclude Part I with an examination of the economic risks that arise from the proliferation of circulating private money (*e.g.*, stablecoins).

A. Economic Theory of Money

We begin with an economic theory of money in market economies. As described in the economics literature, money has several important properties, with the three most commonly stated ones being a store of value, a unit of account, and a medium of exchange.¹³ The property that's most obvious, yet not explicitly stated, is that money also must satisfy the no-questions-asked (“NQA”) principle, which requires the money be accepted in a transaction without due diligence on its value.¹⁴ In other words, NQA means both parties to a transaction must agree that the money be accepted at par—a ten-dollar bill should be accepted as being worth ten dollars, not a penny less.

Bankers have understood this concept for a while. In congressional hearings in 1894, Charles C. Homer, the President of the Second National Bank, identified the desirable properties of money: “I believe in having a good [bank] note; a note that will pass from hand to hand *without the least question or doubt* as to it bringing the amount for which it was issued.”¹⁵ In 1890, the Supreme Court of Indiana noted the same intuition in *Hancock v. Yaden*:

It is not simply the government, as a government, that is interested in the power to establish and maintain a standard of value; for every citizen engaged in any business of life it is of vital importance that there should be a fixed and

¹³ See, *e.g.*, N. Gregory Mankiw, PRINCIPLES OF ECONOMICS.

¹⁴ The NQA principle is due to Bengt Holmström, *Understanding the Role of Debt in the Financial System*, BANK FOR INTERNATIONAL SETTLEMENTS WORKING PAPER NO. 479 (Jan. 14, 2015), <https://www.bis.org/publ/work479.htm>.

¹⁵ Charles C. Homer, *Hearings before the Committee on Banking and Currency, Fifty-third Congress, Third Session* (1894-1895) at 118 (emphasis added).

unchanging standard. Without it, business, except of the most meagre kind, would be at an end, and commerce would be practically annihilated.¹⁶

Indeed, the court was asserting that it would be *economically efficient* to have a “fixed and unchanging standard” of value. Again, these observations are essentially saying that money should circulate at par with no questions asked. The price should be constant at par—a dollar is a dollar—so the less-informed cannot be taken advantage of in transactions. In this case, the money is produced such that no one finds it profitable to produce (private) information about the backing for such money, and everyone knows that this is the case.

Put differently, money is supposed to be *information-insensitive*; money is special *because its price is not supposed to change*. The price adjustments that occur because of changes in supply and demand—like the price adjustments for bananas—do not apply to money. A one-dollar bill is to always transact for one dollar without question. However, if the price does not change, then the laws of supply and demand require that the quantity must change. These adjustments occur most dramatically during a bank run when the outstanding quantity of the privately produced money is severely reduced.

These ideas were formalized in the economics literature over the past few decades.¹⁷ For instance, Dang, Gorton, and Holmström show that the optimal way to produce information-insensitive money is by designing the money to be debt and backed by debt—hence, debt-on-debt. Examples include free bank notes backed by state bonds, demand deposits backed by portfolios of loans, and repurchase agreements (“repos”) backed by debt collateral. Debt-on-debt maximizes information-insensitivity. We take this as a theory of money in market economies and use information-insensitivity as the benchmark.

B. Taxonomy of Money in the Modern Economy

In academic and policy discussions, certain commenters assert that private money has always coexisted with sovereign money and, therefore, the proliferation of stablecoins is no big deal. They view stablecoins as just another deposit account at a bank. That is false. To understand why that is a mistaken view, we categorize types of money into

¹⁶ 121 Ind. 366 (1890).

¹⁷ See Gary Gorton & George Pennacchi, Financial Intermediaries and Liquidity Creation, 45 JOURNAL OF FINANCE 49 (1990); Bengt Holmström, *Understanding the Role of Debt in the Financial System*, BANK FOR INTERNATIONAL SETTLEMENTS WORKING PAPER No. 479 (Jan. 14, 2015), <https://www.bis.org/publ/work479.htm>; Tri Vi Dang, Gary Gorton & Bengt Holmström, *The Information View of Financial Crises*, 12 ANNUAL REVIEW OF FINANCIAL ECONOMICS 39 (2020).

a 2x2 matrix: (1) circulating private money, (2) circulating sovereign money, (3) account-based private money, and (4) account-based sovereign money. Private money is a claim where issuer (obligor) is a private firm, not a public institution; and sovereign money is a claim where the federal government is either the issuer or the guarantor.¹⁸ Account-based money refers to money in a specific bank account, whereas token-based money can circulate as a medium of exchange outside of accounts.

As stablecoins are presently designed, they fit into the upper-left quadrant of the matrix because they are privately issued and can circulate as tokens. They are digital versions of cash, but privately produced. This is why stablecoin issuers observe that consumers will one day use stablecoins (stored in their digital wallets) to pay for items in the same way that consumers now use cash (stored in their physical wallets) to pay for items. Stablecoins are designed to be a digital substitute to physical cash. In this article, we treat stablecoins as they are inherently designed: as digital tokens that have the ability to circulate like money outside of an account-based system.

Table 2: Examples of Different Types of Money

	Private Money	Sovereign Money
Token-Based Money	Stablecoins	Cash
Account-Based Money	Uninsured Bank Deposits Money Market Funds Repurchase Agreements	Insured Bank Deposits Federal Reserve Accounts

Suffice it to say, account-based private money is everywhere in today’s economy, running in the trillions of dollars. Repurchase agreements (“repos”) constitute nearly \$2.5 trillion in account-based private money. Shares of retail and institutional money market mutual funds add to up over \$4.5 trillion in account-based private money. Aside from these fancy-sounding financial instruments, even airline miles are technically account-based private money. The most straightforward example of account-based sovereign money is FDIC-insured deposits at banks. These deposits are sovereign money because the federal government is the guarantor of those deposits. (Uninsured bank deposits, on the other hand, are account-based private money.)

¹⁸ Ricks, *supra* note 9.

Because account-based private money is so ingrained in our economy, many do not view coexistence as a problem.¹⁹

Next, consider the distinction between account-based money and token-based money. Account-based money refers to money in a specific bank account. For instance, a buyer writing a check to a seller links the payment to the buyer’s bank account. That money—specifically, U.S. dollars—will be deposited in the seller’s bank account when the check clears (*i.e.*, when the U.S. dollars are drawn from the buyer’s account and sent to the seller’s account). Account-based money does not circulate. It does not pass hand-to-hand in a chain of transactions that are separate from the check-clearing process, because the identity of the check writer matters. Consequently, endorsing a check that was written to you and using the endorsed check to buy groceries does not happen because the grocery store does not know the identity of the check writer. Some may argue that bank deposits do circulate via payment platforms like PayPal or Venmo. While these technology platforms certainly allow for increased transactions, they do not deviate from the account-based model described here. Money transferred through PayPal or Venmo still go from one account to another. This is simply another form of check writing, account-based money.²⁰

Circulating money, on the other hand, is not history dependent or identity-linked. It is fungible like cash: A ten-dollar bill is a ten-dollar bill. It does not matter who held the ten-dollar bill 100 transactions ago because it is not linked to an individual’s identity. Technically speaking, gift cards are circulating money, but they are contained to specific ecosystems (*e.g.*, the Starbucks ecosystem) and are not able to scale up to challenge circulating sovereign money as a medium of exchange. Stablecoins are circulating money, are already in the hundreds of billions, and have the capacity to scale up into the trillions. They can be used in transactions like cash. As such, stablecoins can become a substitute for U.S. dollars. Thus, when we argue about the “coexistence” of private and sovereign money, we are specifically referring to the coexistence of two forms of circulating, token-based money.

C. Circulating Private Money Is a Problem

From an economics perspective, there are two crucial problems with respect to circulating private money: heightened risks to financial stability and the erosion of

¹⁹ See, *e.g.*, U.S. Department of the Treasury, THE FUTURE OF MONEY AND PAYMENTS (2022) at 4 (asserting that “[p]ublic and private money have coexisted throughout U.S. history”). But, as we argue, there is an important distinction between circulating private money and account-based private money.

²⁰ See also Jess Cheng & Joseph Torregrossa, *A Lawyer’s Perspective on U.S. Payment System Evolution and Money in the Digital Age*, FEDS NOTES (Feb. 4, 2022) (explaining the modern tiered U.S. payment system).

monetary sovereignty. We discuss each in turn before proceeding to historical case studies in Parts II and III.

Financial Stability. The proliferation of stablecoins would weaken financial stability. To be sure, the economic theory of information-insensitivity applies to both account-based private money and token-based private money. When investors start asking questions about the robustness of the money that they are using, they will almost surely run on the issuer of the money. This financial stability risk has manifested itself throughout history, as seen with uninsured bank deposits before the advent of FDIC deposit insurance, repos during the 2008 financial crisis, and money market funds in 2008 and 2020.

Although both account-based private money and token-based private money share this common financial stability weakness, there is one notable difference between the two. Account-based money is the dominant form of money in today's economy by design and has corresponding regulatory guardrails. Since the early 20th century, generations of financial regulators have established guardrails, like FDIC deposit insurance, around account-based money. Notably, deposit insurance is not designed around circulating money. Trying to insure circulating stablecoins may not even be feasible under the current model.

If the current insurance model were applied to stablecoins, it would only insure the amount of stablecoins in a particular holder's account and not the amount of stablecoins that are circulating outside of the account. To see this distinction more clearly, suppose your account at the bank has \$100 in it—\$80 in private stablecoins and \$20 in sovereign cash. You withdraw \$70 in stablecoins and spend these digital coins buying groceries. Those \$70 of stablecoins are now circulating in the economy and are no longer connected to you or your account. The current deposit insurance framework safeguards the \$10 of stablecoins and \$20 of cash remaining in your account at the bank. The \$70 of circulating stablecoins are not covered, yet they are still runnable liabilities of the stablecoin issuer. In addition, consider the fact that the bank could theoretically give stablecoins to individual and businesses that borrow from the bank. Those stablecoins are also not insured unless the borrowers store those stablecoins in accounts. In all these scenarios, the stablecoins are still runnable liabilities of the stablecoin issuer. The issuer is required to honor the redemption of those stablecoins if holders suddenly demand cash in return.

In order for stablecoins to be adequately insured, the deposit insurance framework would likely have to change. Specifically, the coins themselves would have to be insured. Moreover, the amount of insurance cannot be limited as it is now—set at \$250,000 per account. A single party could hold \$1,000,000 in stablecoins, but only

\$250,000 would be insured even if these coins are not deposited in the bank. The amount of federal insurance would potentially be huge. Therefore, it seems that government insurance for all coins would not be feasible. It is important to recognize that current financial regulatory guardrails arose endogenously under an account-based money system. Financial regulators are not prepared for a return to a world in which circulating private money becomes the dominant monetary model. That would present significant dangers to the financial system.

Monetary Sovereignty. The proliferation of private stablecoins would erode monetary sovereignty. Consider the following scenario: You go to Starbucks to buy a coffee. There are several ways for this transaction to occur. First, you can pay with cash. Second, you can pay with a debit card or credit card. Third, your friend can pay for your coffee and, in return, you can Venmo your friend or write him a check. In all three of these cases, you are using U.S. dollars to complete the transaction. In the first example, you are using circulating sovereign money in the form of Federal Reserve Notes (*i.e.*, the cash in your wallet). In the two other examples, you are transferring U.S. dollars between accounts—from your bank account to someone else’s account.

Now, suppose you pay for coffee at Starbucks with stablecoins. You are completing the transaction with private digital tokens from your digital wallet. No U.S. dollars change hands. You are essentially using a different currency. Commenters might point out that stablecoins can be pegged to the U.S. dollar, which should lessen the erosion of monetary sovereignty. But that does not mean stablecoins are U.S. dollars. Indeed, over a dozen countries have pegged their currencies to the U.S. dollar and they are certainly not issuing U.S. dollars. Commenters also note that many stablecoin issuers keep U.S. dollar-denominated assets in reserve (to maintain the peg), which should strengthen the U.S. dollar. But those U.S. dollars sit in reserve and are not used in transactions. It is the stablecoins that circulate and settle transactions. If stablecoins truly proliferate, then prices at Starbucks may one day be quoted in stablecoins instead of dollars. Stablecoins would become the unit of account.

While this outcome may seem farfetched, economic theory and history suggest it is well within the realm of feasibility. Indeed, Gopinath and Stein show that the increased use of a currency for cross border trade leads to greater usage of the currency as a unit of account, and ultimately as a store of value. This is exactly what occurred in the 20th century as the U.S. dollar overtook the British pound sterling as the world’s reserve currency.²¹

²¹ See Gita Gopinath & Jeremy C. Stein, *Banking, Trade, and the Making of a Dominant Currency*, 136 Q. J. ECON. 783 (2020).

Another way to appreciate the threat to monetary sovereignty is to recall the money supply pyramid taught in elementary macroeconomics textbooks. Economists use four main measures of the money supply—known as M0, M1, M2, and M3. At the bottom of the money pyramid is M0, which consists of circulating sovereign money and is called “the monetary base.” The rest of the money supply is built on top of the M0 monetary base, and it is all account-based money. For example, M1 includes M0 as well as account-based demand deposits. M2 includes M1 plus account-based savings accounts, time deposits under \$100,000, and retail money market funds. M3 includes M2 plus larger time deposits and institutional money market funds.²² Thus, the U.S. economy’s monetary base consists of circulating sovereign money, and the rest of the monetary infrastructure is an account-based system built on top of that M0 foundation. Because stablecoins are a competitor circulating currency, it could form its own separate monetary system, with its own account-based M1, M2, and M3 built on top.

Today, stablecoins are already well over \$100 billion in market capitalization. Stablecoins are not yet eroding monetary sovereignty because they are circulating in a confined ecosystem—specifically in the ecosystem of cryptocurrencies. They are used primarily in the speculative trading of Bitcoin, Ethereum, and other cryptocurrencies. The concern with respect to monetary sovereignty is that, in the not-too-distant future, stablecoins could expand beyond the cryptocurrency ecosystem, have a market capitalization in the trillions or tens of trillions, and compete with U.S. dollars in everyday economic transactions. At that point, central banks would clearly see the importance of Paul Tucker’s insight: “We are able to implement monetary policy because the economy has a demand for central bank money and, *as monopoly suppliers*, we can set the terms on which we provide it.”

²² Mike Finnegan, *Money Supply*, Federal Reserve Bank of Richmond Econ Focus (2019), https://www.richmondfed.org/publications/research/econ_focus/2019/q1/jargon_alert.

Part II. The Circulation of Privately Issued Money

In this Part II and the next Part III, we highlight historical case studies to support our arguments in Part I. These case studies will demonstrate that circulating private money generally does not have a fixed and unchanging standard of value because it does not satisfy the NQA principle.²³ It is information-*sensitive*. There is typically an incentive for private parties to produce more information about the money, thereby demanding discounts from par.

So, why did such money exist in the first place? Because through the 18th century, there was a shortage of specie. There wasn't enough sovereign money to go around, so private money filled the gap. Were there cases in which circulating private money did not satisfy the NQA condition but were still successful in circulation? Yes, such cases existed, but only in a *limited geographical area*. The leading examples are (1) Scottish free bank notes and (2) English inland bills of exchange. These forms of private money circulated in the 18th century and early 19th century. We discuss each in turn.

A. Circulating with Unlimited Liability

Scottish bank notes and English inland bills of exchange—both existing in the 18th and early 19th centuries—were examples of privately produced money where the issuers had *unlimited liability*. These money forms were backed by the wealth of the partners in Scottish banks and the signatories to the inland bills, respectively. In other words, these private monies were information-sensitive. Identities mattered.

1. Scottish Free Banking

From 1716 to 1844, Scottish banking was characterized by free entry and unlimited note issuance. The banks issued their own distinctive monies. Three banks had limited liability and the rest had unlimited liability. Unlimited liability meant that the identities of the bank partners were critical to the monies circulating as a hand-to-hand currency.²⁴

Who were these bank partners? They appear to have been the well-known and well-to-do. For example, the Dundee Banking Company, which began in Glasgow in 1763, had 36 partners, including merchants and landed gentlemen of the region. The goal

²³ See Gorton & Zhang, *supra* note 3.

²⁴ See Charles Munn, *THE SCOTTISH PROVINCIAL BANKING COMPANIES, 1747-1864* (1981) at 5 (“[M]any bankers pointed this [unlimited liability] out to their potential customers in the hope that public faith in their banks would be enhanced by the knowledge that the whole property of the partners could be attached in cases of failure. This knowledge encouraged people to hold banknotes especially if the partners were men of substance.”).

was to “involve a major part of the town’s business community in the bank. It was to be a town’s affair in the most complete sense.”²⁵ As another example, the Banking Company of Aberdeen, formed in 1767, had 297 partners. By having such a large number of wealthy partners sign up for unlimited liability, “the Banking Company of Aberdeen flattered itself that ‘their Security will be allowed nothing inferior to any Bank or Company in Europe.’”²⁶ The partners of Ship Bank also fit the mold. According to Boase:

The town mansions of these gentlemen are worth noticing. That of Provost Colin Dunlop, the leading partner of the banking firm, and great-grand-father of the present James Dunlop, Esq., of Tollcross, . . . Dunlop Street was named after him, and carried through his garden behind the mansion. The residence of Mr Houston was a little further west. . . Mr Macdowal’s was the princely edifice so well known in Glasgow story. . . popularly known as “The Shawfield Mansion.”²⁷

Some of these banks with unlimited liability had hundreds of partners. For instance, the Commercial Banking Company had 508 partners and the National Bank of Scotland had 1,238 partners.²⁸

Scottish bank notes were successful in a limited geographical area because the identities of the bank partners, who faced unlimited liability, were typically well-known rich individuals. Users of the notes knew who the bank partners were. But there was a problem: The notes could not circulate very far away because, at a distant location, people would not know the identities of the bank partners.²⁹

During this period, Scottish banks did experience bank runs and failures. According to Munn, “war with revolutionary France in 1793 caused a run on the banks. In the rush for liquidity two Glasgow banks failed.”³⁰ In 1797, there was another bank run, following rumors of a French invasion of England and banks had to suspend

²⁷ C. W. Boase, *A CENTURY OF BANKING IN DUNDEE* (1867) at 16. *See also* Friedman & Schwartz, *supra* note 1, at 50 (“Scotland was an old, established community, with a relatively stable population, so that stockholders consisted in the main of persons who were well-known, had considerable private wealth and valued their own reputations for probity highly enough to honor their obligations”).

²⁸ Sir John Clapham, *THE BANK OF ENGLAND, A HISTORY* (1970) at 91.

²⁹ *See* Munn, *supra* note 23, at 22 (noting that “most provincial bank notes had a purely local circulation in and around their place of issue”).

³⁰ *Id.* at 49.

payments.³¹ Furthermore, Checkland notes that there were banking panics in 1810-11, 1818-19, 1825-26, 1836-37, 1839, and 1845-47.³²

The Scottish free banking example has been trumpeted by some as a demonstration that free banking worked well.³³ And compared to, say, English banking at the same time, it seems that Scottish free banking did work well. Our point is that the circulation of privately produced monies in Scotland was accompanied by very special conditions. Those information-sensitive monies were supported by unlimited liability against the wealthiest individuals in Scottish society and circulated only within a narrow geographic area.

2. English Inland Bills of Exchange

The same problem of individual identities (*i.e.*, information sensitivity) arose with English inland bills of exchange.³⁴ Inland bills of exchange, where all parties to the bill were in England, were a unique form of private money that circulated predominantly as a hand-to-hand currency in the industrial north of England in the latter half of the 18th and first half of the 19th centuries.

Inland bills of exchange arose in the industrial north of England as a hand-to-hand currency due to a constrained supply of specie. Workers were paid with coins, which were scarce. Society needed an alternative form of money. But English banks were weak. During the 17th and most of the 18th century, English banks were limited to no more than six partners—unlike Scottish banks, which had dozens or hundreds of backing partners. Though the English bank partners faced unlimited liability, the limited number of backing partners resulted in banks that often failed. While inland bills of exchange were debt, such bills were not produced by banks and differed from bank debt, such as bank notes or deposits, in fundamental ways.³⁵

³¹ *Id.* at 54.

³² Checkland, *supra* note 24, at 403.

³³ Munn's comment on this debate is instructive: "I feel that the debate tends to force history into a strait-jacket of economic theory which, like all strait-jackets, is very uncomfortable." Charles Munn, *Comment on Chapter 2*, in UNREGULATED BANKING: CHAOS OR ORDER? edited by Forrest Cappie and Geoffrey Wood (1991) at 68.

³⁴ See Gary B. Gorton, *Private Money Production Without Banks*, NBER Working Paper No. 26663 (2020), <https://www.nber.org/papers/w26663>.

³⁵ Henry Thornton, AN ENQUIRY INTO THE NATURE AND EFFECTS OF THE PAPER CURRENCY ON GREAT BRITAIN (1802) at 44-45 (noting that "Liverpool and Manchester effect the whole of their larger mercantile payments not by country bank notes, of which none are issued by the banks, but by bills at one or two months due").

Bills of exchange circulated via indorsement,³⁶ putting each indorsers' wealth at risk if the borrower failed. This was the key feature: *All* parties indorsing the bill were liable. According to Tournay:

The indorsee or holder of a bill transferable by indorsement, is entitled to look to the acceptor for payment, and in case of non-payment by him when presented, then to the drawer and the last and all intermediate indorsers, or parties whose names are on the bill; the last indorser or any intermediate indorser, after payment as holder, is entitled to look to the acceptor and drawer, and all his preceding indorsers, to refund him; the drawer being entitled to look to the acceptor for payment. In the case of a note, the maker stands, as has been already observed, in the position of the acceptor.³⁷

The joint liability rule meant that the receiver of a bill in payment needed to know the identities of at least one of the parties indorsing the bill and to also believe that this person was substantive. And knowledge of the identities of those other indorsers in the chain would make the bill even more credible.³⁸ The front and back of a typical bill is shown below.

³⁶ It also helped that, in the industrial north, the population was denser than in agricultural areas, and more literate.

³⁷ Stewart Tournay, *A PRACTICAL GUIDE TO THE LAW OF BILLS OF EXCHANGE* (1851) at 40-41.

³⁸ T. S. Ashton, *The Bill of Exchange and Private Banks in Lancashire, 1790-1830*, 15 *ECONOMIC HISTORY REVIEW* 25, 26 (1945) (observing that “since each successive holder indorsed it, the more it circulated the greater the number of guarantors of its ultimate payment into cash”). See also Knut Wicksell, *INTEREST AND PRICES* (1936) at 63 (“While every expansion of simple credit is necessarily bound up with increasing risk, the security of a bill as a commercial instrument increases with the number of indorsements it carries and consequently with the number of money payments that it has provided the means of obviating”).

In sum, both Scottish bank notes and English inland bills of exchange tell a similar story. Users had to know the identity and creditworthiness of the counterparty. The monies were information-*sensitive*. Consequently, bills only circulated in a narrow geographical region. As described by Burgess:

In the manufacturing districts of Yorkshire and Lancashire, no man, generally speaking, thinks of paying for any commodity above the value of ten pounds, otherwise than in a bill after date. This practice is now very general throughout the northern and midland counties, and is increasing in other parts. . . A bill for £100 payable after date, which to-day is paid at Folkingham for wool, tomorrow at Melton for horned cattle, the next at Leicester for sheep, and the succeeding day at Oundle for bark, is as much a part of the circulating medium, representing the transfer of commodities from hand to hand, as a bank-note for £100.³⁹

According to Google Maps, Folkingham to Melton is 46 km (28.6 miles), Melton to Leicester is 27 km (16.8 miles), and Leicester to Oundle is 57 km (35.4 miles). The total distance is 130 km (80.8 miles).

B. Circulating with Limited Liability

We next turn to an example of information-*sensitive* money that circulated with *limited* liability. Prior to the U.S. Civil War, banks issued their own private bank notes. Banks could open by obtaining a charter granted by a state legislature or, in free banking states, they could deposit the requisite bonds with the state treasurer and issue the corresponding amount of notes. During the Free Banking Era of 1836-

³⁹ Henry Burgess, *A letter to the Right Hon. George Canning: to explain in what manner the industries of the people and the productions of the country are connected with and influenced by internal bills of exchange*, BRISTOL SELECTED PAMPHLETS (1826) at 19-20, <http://www.jstor.org/stable/60248126>.

1863, eighteen states adopted a version of free banking and fifteen retained the chartered banking system.

At that time, the government did not print money, and there was a shortage of specie.⁴⁰ Private bank notes were used widely as an alternative.⁴¹ The notes could be redeemed at par on demand at the issuing bank. Indeed, within a nearby vicinity of the issuing bank, the notes circulated at par. However, these private bank notes circulated at discounts away from the issuing banks. For example, a bank’s notes might trade at a 10 percent discount 100 miles away from the issuing bank (*i.e.*, a one-dollar note was only worth 90 cents at the distant location). At a distance, the note discounts reflected risk factors of the issuing bank.⁴² Roughly 1,500 bank notes of different banks circulated, depending on the year. Consequently, there was a well-developed market for bank notes with fluctuating discounts.

Newspapers that published the discounts on notes covered bank notes from many distant banks. Van Court’s Bank Note Reporter, published in Philadelphia, covered a total of 3,089 banks in 35 states, territories, and provinces of Canada.⁴³ Notably, bank note reporters were published in many cities. Larger cities had more than one bank note reporter, as shown in the table below.⁴⁴ Thus, unlike Scottish bank notes or English inland bills of exchange, U.S. private bank notes were more extensively used across various geographic regions.

Table 3: Bank Note Reporters at Different Centers

Location	Number of Reporters
New York City	22
Boston	3
Buffalo	2
Chicago	4
Cincinnati	12
Detroit	2

⁴⁰ As the reader can probably tell by now, a shortage of specie was a common theme motivating the proliferation of privately produced money.

⁴¹ See William M. Gouge, A SHORT HISTORY OF PAPER MONEY IN THE UNITED STATES (1833) at 57 (observing that ““of large payments, 999 in a 1,000 are made with paper. Of small payments, 99 in a 100. The currency of the country is . . . essentially a paper currency”).

⁴² See Gary B. Gorton, *Reputation Formation in Early Bank Note Markets*, 104 JOURNAL OF POLITICAL ECONOMY, 346 (1996).

⁴³ This table is from Gary B. Gorton, *Pricing Free Bank Notes*, 44 JOURNAL OF MONETARY ECONOMICS 33 (1999).

⁴⁴ This table is from William Dillistin, BANK NOTE REPORTERS AND COUNTERFEIT DETECTORS, 1826-1866 (1943).

Where did the discounts come from? They came from secondary markets where note brokers would trade the notes of distant banks and, if deemed profitable, take them back to the issuing bank for redemption (*i.e.*, arbitrage). Bank note reporters published the discounts from these markets.⁴⁵ Clearly, the system was cumbersome and inefficient, but there was no credible alternative. An example of a critique of the system was given by Whitney:

The businessman of to-day knows little by the experience and inconvenience and loss suffered by the merchant of sixty years ago arising from the currency in which debts were paid. Receiving payment in bank notes, he assorted them into two parcels, current and uncurrent. In the first he placed notes issued by solvent banks of his own city; in the other the bills of all other banks. Upon these latter there was a discount varying in amount according to the location and credit of the bank issuing them. How great the discount he could learn only by consulting his "Bank Note Reporter," or by inquiring at the nearest exchange office. He could neither deposit them nor use them in payment of his notes at a bank. The discount on them varies from one percent upwards, according to the distance the bills had to be sent for redemption and the financial standing of the bank by which they were issued.⁴⁶

The system of private bank notes ended when the National Bank Act was passed in 1863 and a prohibitively high tax on bank notes was adopted.

* * *

We can tease out a few useful insights from the cases of Scottish free banking, English inland bills of exchange, and U.S. bank notes prior to the Civil War. First, parties using these circulating private monies had an incentive to produce information. In Scotland, holders of bank notes needed to know the identity of the partners who supported the bank because those partners were subject to unlimited liability. In

⁴⁵ See William O. Scroggs, *A CENTURY OF BANKING PROGRESS* (1924) at 160 (describing how the reporters were used).

⁴⁶ See John J. Knox, *HISTORY OF BANKING IN THE UNITED STATES* (1903) at 365 (quoting D. R. Whitney, who was the president of the Suffolk Bank in Massachusetts and published a book on the bank in 1878).

England, holders of the indorsed bills needed to know the identity of those who indorsed. The wealthier, the better. In the United States, those who used private bank notes had to know the health of the underlying bank and depended on third-party reporters for that information.

Second, these private monies either circulated successfully within a narrow geographic region or circulated at a discount in a broader geographic region. In Scotland and England, private money circulated in concentrated geographic areas, largely where the identities of the partners and guarantors were more well-known. In the United States, private money circulated much more broadly but did so at a discount that depended on distance from the issuing bank.

Finally, because the private monies were information-*sensitive*, they were not always safe. In both the Scottish and American examples, bank runs and bank failures occurred. This concern of financial fragility played a significant role in the path from coexistence to sovereign monopoly, which we explore in the next Part.

Part III. The Sovereign's Money Monopoly

In this Part, we proceed with our historical case studies by reviewing the legislative and policy debates surrounding the sovereign's money monopoly in England, the United States, Canada, and Sweden. England was the first to create a national currency in the first half of the nineteenth century. The United States, Canada, and Sweden started with hybrid systems in which government money—or bonds in the case of the United States—backed the privately produced monies. In short, the case studies show that sovereign money emerged for reasons grounded in both politics and economics. Politically, there was a desire for increased national unity or greater sovereignty generally. Economically, which is our focus, there were perennial debates on improving financial stability and controlling the money supply.

A. England

In England, the sovereign's money monopoly came about primarily in response to repeated financial crises, most immediately the crises in 1835-36 and in 1839.⁴⁷ England had an impressively long history of financial crises. During the 18th century, there were financial crises in 1701, 1710, 1715, 1726, 1745, 1761, 1763, 1772, 1778, 1793, and 1797.⁴⁸ Banks failed frequently—at least 343 bank failures between 1750 and 1830.⁴⁹ According to Joplin's observations on the English banking system in 1822:

When the slightest apprehension is entertained respecting [the banks] solvency, however groundless it may sometimes prove, a run upon the immediately takes place. That is, hundreds of people immediately crowd the doors of the Banks, to demand payment of the Notes they held, or to withdraw that money out of their hands, which they have deposited with them . . . Great however as the inconveniences are which discredit of Banks and consequent runs upon them occasion, and great as are the calamities by which their failures are uniformly attended, they are, both in this country and Ireland, of very common occurrence.⁵⁰

⁴⁷ See J. K. Horsefield, *The Origins of the Bank Charter Act, 1844*, 11 *ECONOMICA* 180, 180 (1944) ("Public opinion was also shocked that help had had to be sought from France in order to maintain the convertibility of Bank Notes.").

⁴⁸ See T.S. Ashton, *ECONOMIC FLUCTUATIONS IN ENGLAND, 1700-1800* at 136 (1959).

⁴⁹ See L. S. Presnell, *COUNTRY BANKING IN THE INDUSTRIAL REVOLUTION* at 443 (1956).

⁵⁰ T. Joplin, *An Essay on the General Principles and Present Practice of Banking in England and Scotland* (1822). See also John A. James, *Panics, Payments Disruptions and the Bank of England before 1826*, 19 *FINANCIAL HISTORY REVIEW* 289 (2012); Julian Hoppit, *Financial Crises in Eighteenth-Century England*, 39 *ECONOMIC HISTORY REVIEW* 39 (1986).

As a result of frequent financial trauma, the Bank Charter Act of 1844—commonly known as Peel’s Act⁵¹—granted the Bank of England a monopoly over note issuance, with a carve-out for private banks issuing notes as of May 6, 1844.⁵²

Peel’s Act was momentous for several reasons. First, it came during a period when free trade principles dominated. This was no doubt the influence of Adam Smith.⁵³ Second, it was a wholistic approach to the issue of bank notes, motivated by the idea that banking should be separated from the control of the currency.⁵⁴ Third, the Act is generally viewed as being the foundation for the Bank of England to become the central bank because of the monopoly over note issuance, which was the source of much controversy.⁵⁵

The passage of Peel’s Act was also influenced by debates surrounding the money supply. The logic of the Act came from the “Currency School,” with the view that the quantity of money and of coin should never be allowed to differ.⁵⁶ From this, it was argued that fluctuations in the value of the standard unit would be constant and that booms and panics would be eliminated. “Over issuance” of notes by country banks would thus be avoided.⁵⁷ Of note, those objecting to the Bank being rechartered argued,

⁵¹ Sir Robert Peel was the Prime Minister at that time. The real name of the Act is “An Act to regulate the Issue of Bank Notes, and for Giving to the Governor and Company of the Bank of England certain Privileges for a Limited Period.” The Act had three other subjects, in addition to the control of bank notes: the separation of the departments of the Bank into the issuing department and the traditional banking department; the establishment of fiduciary issue; and the publication of accounts.

⁵² These banks were allowed to issue in the future but could not exceed their average in early 1844.

⁵³ See Arie Arnon, *Banking between the Invisible and Visible Hands: A Reinterpretation of Ricardo's Place within the Classical School*, 39 OXFORD ECONOMIC PAPERS 268 (1987).

⁵⁴ See P. Barrett Whale, *A Retrospective View of the Bank Charter Act of 1844*, 11 ECONOMICA 109 (1944).

⁵⁵ See A DIGEST OF THE EVIDENCE ON THE BANK CHARTER, TAKEN BEFORE THE COMMITTEE OF 1832 (1833) at 187 (“The 1832 Committee. . . regarded the monopoly question as the most important issue of the day, and made persistent enquiries into the desirability of some limitation of the country banks’ issues. Its witnesses were nearly equally divided for and against.”). Walter Bagehot later wrote that “the issue of money is a fit case for a Government monopoly, because the object aimed at, is not to reduce the cost price, but to render it fixed.” *The Currency Monopoly*, PROSPECTIVE REVIEW (1848).

⁵⁶ Opposed to the Currency School was the “Banking School,” a group centered on the idea that the issuance of bank notes would be naturally regulated by holders wanting to redeem their notes. See J.K. Horsefield, *The Origins of the Bank Charter Act, 1844*, 11 ECONOMICA 180 (1944). See also Charles Goodhart & Meinhard Jensen, *Currency School versus Banking School: An Ongoing Confrontation*, 4 ECONOMIC THOUGHT 20 (2015).

⁵⁷ See, e.g., *Letter to Charles Wood, Esq., M.P., Chairman of the Committee of the House of Commons on Banks of Issue* (1841).

among other points, that this created an inelasticity which would hinder the Bank's ability to respond to panics by increasing the money supply, leading to panic.⁵⁸

In addition to financial stability and the money supply, the debate also raised the issue of who should profit from the Bank's monopoly. Among those in favor of the monopoly were voices that wanted the profits to accrue to the government. Not everyone agreed. George Grote, a London banker, said that he "would have the Bank of England compelled to pay over to the public all profit from their circulation, savings so much as might be fair remuneration for the trouble and risk of administering the details of it."⁵⁹

In the end, the debates and testimony in the Committee of 1832 led to the recharting of the Bank of England and established the Bank's notes as legal tender. According to Orzechowski, the Act "fatally dashed the hopes of free bankers seeking to limit the powers of the Bank of England. The 1833 Act set in motion the eventual elimination of private bank notes so that by 1844 the government was able to stop the issuance of all new private bank notes in England and Wales, thus giving the Bank of England a pure monopoly."⁶⁰

B. United States

In the United States, the road to the sovereign's monopoly over money began during the Civil War. In the 1860s, the government taxed state bank notes out of existence in order to support the growth of national bank notes, which were backed by debt issued by the Treasury. In the subsequent decades, policymakers noted significant problems associated with the inelasticity of the money supply and the frequency of banking panics.

On February 20, 1896, Theodore Gilman, a New York City banker, appeared before the U.S. House Committee on Banking and Currency and introduced a bill that would give private bank clearinghouses the ability to issue money backed by their members' assets. Section 9 of the proposed legislation stated:

⁵⁸ The critics who focused on the inelasticity of the Bank's ability to respond to a crisis came true in the Panic of 1847, which saw a suspension of that restriction. See Rudiger Dornbusch & Jacob Frenkel, *The Gold Standard Crisis of 1847*, 16 JOURNAL OF INTERNATIONAL ECONOMICS 1 (1984) ("The removal of the restriction on fiat money issue dispensed with the concern for the internal convertibility of deposits into notes.").

⁵⁹ *Testimony of George Grote*, A DIGEST OF THE EVIDENCE ON THE BANK CHARTER, TAKEN BEFORE THE COMMITTEE OF 1832 (1833) at 97.

⁶⁰ Paul E. Orzechowski, *George Scrope, Free Bankers, and the Bank Charter Act of 1833*, ESSAYS IN ECONOMIC & BUSINESS HISTORY (2019) at 182.

That a clearing house of issue shall be authorized and empowered to receive from its bank members, or any clearing house within the State or district in which it is located, commercial assets, promissory notes, bills of exchange, convertible bonds and stocks, and other securities and evidence of debt as collateral security for the circulating notes of the said association to be issued.⁶¹

The collateral was to have a 25 percent haircut and the notes issued would be guaranteed by all the clearinghouse members jointly.

The Hearings were motivated by the perceived weaknesses of the National Banking System that had been created during the Civil War. The main complaints alleged against the existing banking system were the inelasticity of the money supply and the frequency of banking panics. The inelasticity was due to the structure of system. The United States had adopted a hybrid system of money in 1863 with the National Bank Act. The Act created banks called national banks, which could issue their own “national bank notes,” but required that these notes be backed by U.S. Treasury bonds. The purpose of requiring that national bank notes be backed by Treasuries was intended to create a demand for Treasury securities which could be issued to finance the North during the Civil War. By linking the bank notes to U.S. Treasuries, the money supply could not be changed easily. This inelasticity of the money supply was widely noted.⁶²

Moreover, the National Bank Act of 1863 was expected to end panics since the national bank notes would be backed by U.S. Treasuries. But the National Bank Act did not end banking panics. There were seven major banking panics during the National Banking Era. In those panics, depositors wanted to withdraw their “deposits” in “cash” (*i.e.*, in national bank notes).⁶³ Deposits had started outstripping bank notes prior to the Civil War.

Thus, the basis for Gilman’s proposal was that private bank clearinghouses were the institutions responding to banking panics. In a banking panic, clearinghouses opened a discount window where members could post collateral and receive “clearinghouse

⁶¹ *Banking and Currency Reform Hearings before the Subcommittee of the Committee on Banking and Currency* (1913) at 90.

⁶² See Edwin Kemmerer, *Seasonal Variations in the Relative Demand for Money and Capital in the United States*, NATIONAL MONETARY COMMISSION (1910) at 13 (“The most common criticism of our American currency system is its alleged inelasticity or irresponsiveness to trade demands, this inelasticity is sometimes considered with particular reference to panic periods which occur at more or less irregular and widely separated times, and sometimes with particular reference to regularly recurring seasonal fluctuations in the demand for money and loanable capital.”).

⁶³ See Gary Gorton, *Banking Panics and Business Cycles*, 40 OXFORD ECONOMIC PAPERS 751 (1988).

loan certificates,” which were the joint liability of the member banks.⁶⁴ Alas, the clearinghouse system could not prevent panics even if it could mitigate some of the bad effects of panics. Six years after the devastating panic of 1907, Congress established the Federal Reserve, the so-called central bank, “to furnish an elastic currency. . . and to establish a more effective supervision of banking in the United States.”⁶⁵ The Federal Reserve was also to provide financial stability. Both goals, an elastic money supply and financial stability, were to be accomplished by setting up a permanent discount window. Further, the national currency would have to be de-linked from U.S. Treasuries. For all these reasons, the United States migrated to a single uniform sovereign currency.

C. Canada

In Canada, the sovereign’s monopoly over money coincided with the establishment of its central bank. Coming out of the Great Depression in the early 20th century, Canada’s political leadership recognized the need for greater control of its money supply as well as greater financial stability.

In October 1929, the U.S. stock market collapsed, and economic depression ensued in North America and around the world. Canada was hit especially hard. The country’s GDP-to-Capital ratio declined by 35 percent from the peak of 1928 to the trough of 1933, compared to a 30 percent decline in the United States.⁶⁶ As in the United States, Canadian farmers were among the hardest hit during the Depression. They were paying 7 percent on mortgages that had been signed in the 1920s but their products were selling for less than one half of their 1926 values.⁶⁷

Canada had no central bank at the time. Farmers were in favor of having a central bank; bankers were opposed. Finally, in 1933, during the fourth year of the Depression, the Royal Commission on Banking and Currency was established to review the banking system and the Canadian government’s involvement in monetary policy.⁶⁸ The commission was chaired by Hugh Macmillan. The commission held hearings throughout Canada and delivered a report. After surveying the Canadian banking and financial system, the Report states:

⁶⁴ See Gary Gorton & Ellis Tallman, *FIGHTING FINANCIAL CRISES* (2018).

⁶⁵ See Federal Reserve Act, ch. 6, 38 Stat. 251 (1913).

⁶⁶ Joe Martin, *THE CREATION OF THE BANK OF CANADA* (2005).

⁶⁷ *Id.*

⁶⁸ *REPORT OF THE ROYAL COMMISSION ON BANKING AND CURRENCY IN CANADA* (1933) (emphasis added).

If we survey the cardinal monetary problems which face the Canadian people in common with all other peoples today, we are immediately confronted with a multitude of difficult and intricate questions. To what extent and through what organizations should the volume of credit and of currency be regulated? On what body should lie the primary responsibility for maintaining the external stability of the country's currency? To what institution may the Government of the day suitably turn for informed and impartial advice on matters of financial policy? . . . In the great, and an increasing, majority of countries the answer to these questions had been found in the *existence of or the creation of a central bank*.

The Bank of Canada was thereby chartered in 1934 when the Bank of Canada Act was passed, and the bank became operational in March 1935.⁶⁹ The Preamble of the Act states:⁷⁰

Whereas it is desirable to establish a central bank in Canada to regulate credit and currency in the best interests of the economic life of the nation, to control and protect the external value of the national monetary unit and to mitigate by its influence fluctuations in the general level of production, trade, prices and employment, so far as may be possible within the scope of monetary action, and generally to promote the economic and financial welfare of the dominion.

Section 24 of the Act gave the bank the sole right to issue notes payable to the bearer on demand and issue notes in any amount. Thus, in the case of Canada, like many other countries, the establishment of a monopoly over the production of money coincided with the founding of the central bank. The reasoning was that the central bank needed monopoly control over money production to fulfill its role as an overseer of the macroeconomy.⁷¹

Another motivating factor was the elasticity of the money supply, particularly whether it was elastic enough to address seasonality associated with crops being planted and harvested. According to Kianief,

⁶⁹ Bank of Canada Act, https://www.bankofcanada.ca/wp-content/uploads/2010/07/act_loi_boc_bdc.pdf.

⁷⁰ *Id.*

⁷¹ See Muharem Kianieff, *Private Banknotes in Canada from 1867 (and before) to 1950*, 30 QUEEN'S LAW JOURNAL 400 (2004) ("The financial system's failure to respond adequately to the challenges of the Depression led to the establishment of the Bank of Canada in 1935, over the objections of many private bankers. The legislation that set up the Bank of Canada provided for a gradual phasing out of private banknotes and their replacement of notes issued by the Bank of Canada.").

Pressure was brought to bear on the money supply mechanism during the crop-moving season, when demand for credit would reach its peak. . . . The year 1907 proved to be a bad one for both the wheat and banking industries, as a low-quality wheat crop had to be moved to market quickly to avoid deterioration. At the time, however, demand for notes was greater than their supply, and the banks could not provide them fast enough to facilitate movement of the crop. The crisis was symptomatic of the larger issue of the inelasticity of the money supply.⁷²

To be sure, political issues played a role as well.⁷³ In the west of Canada there was anti-bank sentiment due to high interest rates and a perceived lack of sufficient credit. And more generally, the public was concerned with the concentration of bank ownership and the banks' influence over the economy through interlocking directorships. The period from 1901 to 1914 was one of bank failures, liquidations, and mergers.

* * *

Similar to the U.S. experience described previously, the Canadian experience also included a circulation of government notes prior to the establishment of a central bank. Specifically, the Canadian government issued "Dominion notes" from 1867 to 1934.

Before the various provinces of Canada were united into what we now know as Canada, provinces issued their own notes. Confederation occurred in 1868 and, with confederation, the Dominion government acquired the right of issuing notes, taking over this function from the provinces.⁷⁴ The Dominion Notes Act of 1868 allowed the government to issue its own notes backed by gold. The Act restricted private bank notes to a minimum denomination of \$4, leaving a monopoly to the government to issue notes of \$4 or less. In today's terms, \$4 would be \$97.87 Canadian dollars in 2022 (or \$78.54 U.S. dollars). Thus, Dominion notes were used to carry out most day-to-day transactions.

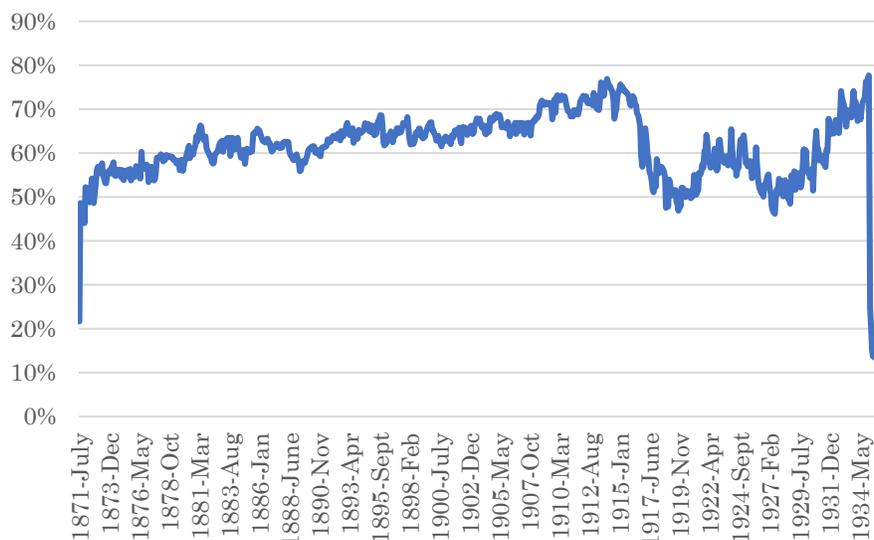

⁷² *Id.* at 425.

⁷³ See Michael D. Bordo & Angela Redish, *Why Did the Bank of Canada Emerge in 1935?*, 47 JOURNAL OF ECONOMIC HISTORY 405.

⁷⁴ "Confederation" refers to New Brunswick and Nova Scotia official joining the Province of Canada. The Province of Canada then split into Ontario and Quebec.

Moreover, Dominion notes were used as reserves by the commercial banks.⁷⁵ This suggests that Dominion notes were the practical hand-to-hand currency. Canadian banks were never required to satisfy a specific level of reserves. But banks were always required to hold at least 40 percent of whatever cash reserves the banks held. Figure 1 below shows the percentage of bank reserves that were Dominion notes.⁷⁶

Figure 1: Ratio of Dominion Notes to Total Reserves

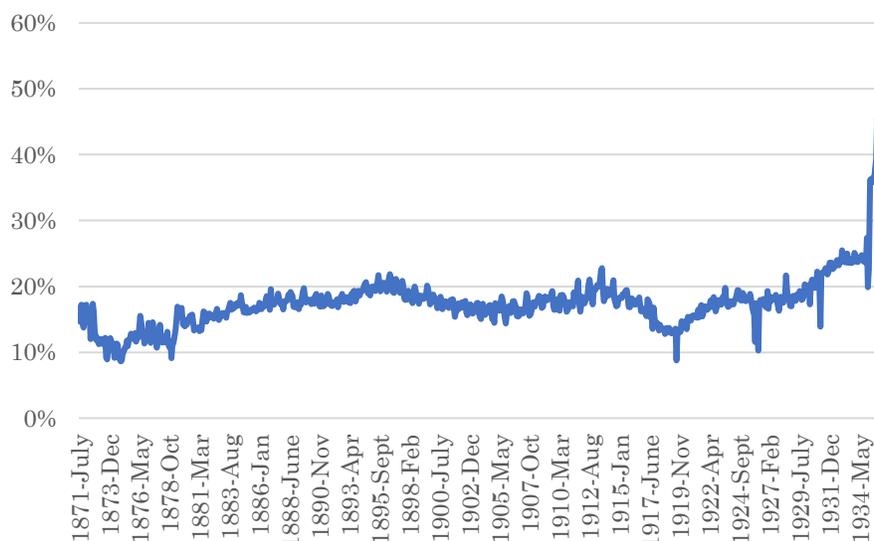

Even though Dominion notes made Canadian currency relatively sound, still, they were relatively small compared to private bank notes, as shown in Figure 2 below.

⁷⁵ These calculations are based on *Historical Statistics of Canada*, Table K33-43, General Wholesale Price Index, 1867-1975. The Historical Statistics only goes through 1975. For 1975 until 2022 we used <https://www.in2013dollars.com/canada/inflation/1975?amount=21.45>.

⁷⁶ The data are from C. A. Curtis, *STATISTICAL CONTRIBUTIONS TO CANADIAN ECONOMIC HISTORY, VOL 1, STATISTICS OF BANKING* (1931).

Figure 2: Ratio of Dominion Notes to Chartered Bank Notes

As in the U.S. experience, private bank notes circulated in Canada because of a lack of specie, and circulated at discounts. That these information-sensitive Canadian bank notes did not circulate at par in all parts of the country was a common complaint.⁷⁷

Various laws were enacted in attempts to eliminate these discounts: The Bank Act of 1871 imposed double liability on bank shareholders. The Bank Act of 1880 gave note holders first lien on bank assets. And the Bank Act of 1890 established the Bank Circulation Fund to redeem the notes of insolvent bank and for note holders to be paid interest as well. Banks were required to pay 5 percent of their previous 12 months' circulation to the Minister of Finance to form this Fund.⁷⁸

* * *

⁷⁷ Roeliff Breckenridge, *The History of Banking in Canada*, NATIONAL MONETARY COMMISSION (1910) at 112 (“Being a frequent annoyance, the discount for geographical reasons constituted no inconsiderable grievance.”).

⁷⁸ See Ben Fung, Scott Hendry & Warren Weber, *Canadian Bank Notes and Dominion Notes: Lessons for Digital Currencies*, Bank of Canada Working Paper 2017-5 (“[B]ank notes were only relatively safe and not a uniform currency before 1890. They were relatively safe because only 3 of the 55 banks in existence between 1866 and 1890 failed with losses to note holders. They were not a uniform currency because notes of banks in one geographic location often traded at a discount in another location and notes of suspended banks traded at a discount until the bank’s affairs were settled. The Bank Act of 1890 made bank notes perfectly safe and a uniform currency.”).

The Canadian system, like the pre-Civil War system in the U.S. and like other countries, began with private bank notes that traded at discounts. The system evolved into a hybrid system where Dominion notes were used as reserves for the banks. The sovereign's monopoly over money coincided with the establishment of its central bank. Coming out of the Great Depression in the early 20th century, Canada's political leadership recognized the need for greater control of its money supply as well as greater financial stability.

D. Sweden

Sweden's debate over the sovereign's money monopoly revolved around financial stability, first and foremost, but also the ability to control its money supply.

Private banks in Sweden—known as Enskilda banks—issued their own bank notes from 1831 to 1904. Interestingly, Sweden already had public money at the time, so why did Swedish private currency circulate when there was already a public currency in circulation? The Riksbank was constrained by how much money it could issue. Of note, Sweden re-established the silver standard in 1834, which the country had abandoned in 1809.⁷⁹ Thus, from 1834 until the onset of World War I, the main objective of the Riksbank was to maintain the silver standard. As a result, there was a shortage of money in Sweden during the 19th century.⁸⁰ According to Ögren:

The initial extent of Swedish poverty during this period is well illustrated by the very limited and stagnant circulation of metallic coins, as well as a supply of specie metal insufficient to provide the country with an adequate supply of generally accepted means of payments. Instead, the Swedish economy relied heavily on personal credits, IOUs, and other types of informal means of payments, accepted only on a personal or regional basis, thus hindering more widespread economic integration.⁸¹

⁷⁹ See Anders Ögren, *Free or Central Banking? Liquidity and Financial Deepening in Sweden, 1834-1913*, 43 *EXPLORATIONS IN ECONOMIC HISTORY* 64 (2006).

⁸⁰ Moreover, the Riksbank initially issued denominations that were more useful for wholesale payments than retail payments. Enskilda banks were able to fill the initial vacuum by issuing notes of lower denominations. See Lars Jonung, *Private Bank Notes in Sweden 1831-1902*, Mimeo, Stockholm School of Economics (2007).

⁸¹ See Ögren, *supra* note 80.

Enskilda banks therefore contributed to economic expansion and integration by providing a money supply beyond what would have been possible for the Riksbank.⁸² In fact, by 1859, the volume of private bank notes in circulation exceeded that of Riksbank notes in circulation.⁸³ Private bank notes were sent all over the country, not just to certain (rural) areas.⁸⁴ Following the proliferation of this new money supply, economic growth increased dramatically in the subsequent decades.⁸⁵

* * *

The system of Enskilda banks was not entirely private for a couple of reasons. First, Enskilda banks' note issuance was backed by, and redeemed for, money issued by the Riksbank. This was a form of “bottom-up” central banking because the Enskilda banks voluntarily relied on Riksbank notes rather than specie for reserves. Indeed, the holdings of Riksbank notes by Enskilda banks were between 30 percent and 50 percent through the 1860s. Before Sweden passed the 1874 law—a law that required Enskilda banks to back their note issuance with gold—Enskilda banks held almost zero specie as reserves.⁸⁶

Second, according to Fung, Hendry, and Weber, the Riksbank acted as a lender of last resort for the Enskilda banks on at least two occasions—first during the crisis of 1856-1857 and second during the crisis of 1878-1879.⁸⁷

This instability concern was not lost upon the government when it made its final decision to ban private bank notes and give the monopoly to the central bank. Following that second crisis in 1878-79, public opinion turned against the Enskilda

⁸² See Gabriel Söderberg, *Why Did the Riksbank Get a Monopoly on Banknotes?*, SVERIGES RIKSBANK ECONOMIC REVIEW (2018) (noting that Enskilda banks were allowed by the Swedish Riksdag in 1824 as a conscious strategy to promote the growth of a banking system in Sweden).

⁸³ See Anders Ögren, *Empirical Studies in Money, Credit and Banking: The Swedish Credit Market in Transition under the Silver and the Gold Standards, 1834-1913*, EHF – Stockholm School of Economics, Studies in Economic History No. 2 (2003).

⁸⁴ See Torbjörn Engdahl and Anders Ögren, *Multiple Paper Monies in Sweden 1789-1903: Substitution or Complementarity?*, 15 FINANCIAL HISTORY REVIEW 73 (2008).

⁸⁵ See Anders Ögren, *Financial Revolution and Economic Modernization in Sweden*, 16 FINANCIAL HISTORY REVIEW 47 (2009).

⁸⁶ See Ögren, *supra* note 84. See also Söderberg, *supra* note 83.

⁸⁷ See Ben Fung, Scott Hendry & Warren E. Weber, *Swedish Riksbank Notes and Enskilda Bank Notes: Lessons for Digital Currencies*, Bank of Canada Staff Working Paper 2018-27 (2018), <https://www.bankofcanada.ca/2018/06/staff-working-paper-2018-27/>.

banks. A newly formed special committee on banking recommended that the Riksbank be granted a monopoly on the issuance of notes.⁸⁸

That final decision arrived in 1897 when the Riksbank was given a monopoly on note issuance, and the Enskilda bank notes went out of circulation shortly thereafter. In its decision to ban private bank notes, the Swedish government cited banking panics (*i.e.*, financial stability)⁸⁹ and the credit cycle (*i.e.*, controlling the money supply).⁹⁰

⁸⁸ See Ögren, *supra* note 84.

⁸⁹ See Söderberg, *supra* note 83, at 12 (citing Bankkomitén (1883), *Bankkomiténs underdåniga förslag till förändrad organisation af bankanstalterna* [Special Committee on Banking—proposed changes in bank organization]) (“It was emphasized that, even if the private banknotes were relatively secure, their security would be even higher if they were issued by a single institution.”)

⁹⁰ See *id.* (noting the concern that “that banknote issuance will be too extensive in good times and too restricted in bad times”).

In addition, there was seasonality in the private money supply. The notes issued by Enskilda banks followed a seasonal pattern, which corresponded with the seasonal demand for liquidity of the agricultural cycle. Specifically, there were two peaks per year—one from February to April and the second from October to November. See Engdahl & Ögren, *supra* note 85.

Part VI. Challenging the Assumption of Coexistence

The widespread assumption is that private stablecoins should circulate alongside sovereign money. Members of Congress have expressed these views, as have senior officials at the Federal Reserve. Should we maintain the sovereign's money monopoly? Or should we turn back the economic clock by two centuries? In this Part, we first summarize recent market developments that demonstrate the financial vulnerability inherent to stablecoins. We then examine legislative proposals aimed at coexistence and present the problems with such coexistence.

A. Runs on Stablecoin Issuers

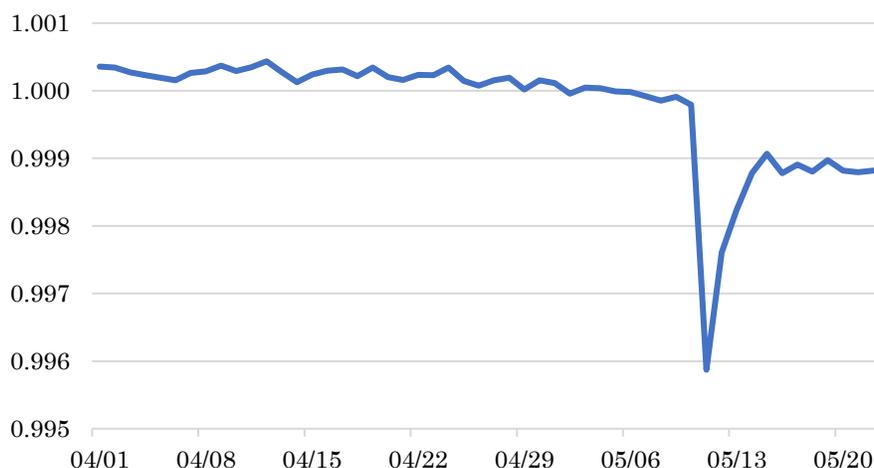

Stablecoin issuers are unregulated banks that are vulnerable to bank runs. In May 2022, the sharp decline in the price of Bitcoin and the death spiral of an “algorithmic stablecoin,”⁹¹ TerraUSD, were enough to knock some stablecoins off their pegs.⁹² For instance, Tether, the largest stablecoin at over \$75 billion in market capitalization, dipped below \$0.97, as shown in Figure 3. Tether holders withdrew \$7 billion from Tether during the panic.⁹³

⁹¹ Algorithmic stablecoins work something like this: There are two coins, say, \$1Coin and another coin, OCoin. \$1Coin is supposed to be pegged to \$1, while the price of OCoin can be anything. The idea is that if \$1Coin trades at \$0.99 then there is a process by which more OCoins are printed and used to buy \$1Coins until the price is \$1 again. If \$1Coin trades at \$1.01, then the process allows some more \$1Coins to be printed and used to buy OCoins until the price is back to \$1. Of course, neither \$1Coin or OCoin are worth anything, so this is just a fancy kind of fiat cryptocurrency. In our discussions of stablecoins, we are concerned with those that are backed by cash and safe assets, are pegged to a fiat currency like the U.S. dollar, and are redeemable on demand. Our analysis is not focused on algorithmic stablecoins. See, e.g., Ryan Clements, *Built to Fail: The Inherent Fragility of Algorithmic Stablecoins*, 11 Wake Forest L. Rev. Online 131 (2021).

⁹² See also Peter Santilli & Corrie Driebusch, *How More Than \$1 Trillion of Crypto Vanished in Just Six Months*, WALL STREET JOURNAL (May 13, 2022).

⁹³ Scott Chipolina, *Investors Pull \$7bn from Tether As Stablecoin Jitters Intensify*, FINANCIAL TIMES (May 17, 2022). See also David Yaffe-Bellany, *The Coin That Could Wreck Crypto*, NEW YORK TIMES (Jun. 17, 2022) (“Concern is mounting over another potential vulnerability in the crypto market: Tether, a company whose namesake currency is a linchpin of crypto trading worldwide.”).

Figure 3: Tether's Peg in May 2022

Interestingly, the economic “shock” that hit the market for digital assets was simply the Federal Reserve raising interest rates to combat inflation—not a wild phenomenon given the fact that the Federal Reserve’s job requires it to adjust interest rates. Imagine if a real shock hit the financial markets along the lines of what occurred during September 2008, when Lehman Brothers collapsed.

This is a preview of the future, and it should not be surprising given what we know from economic theory and what we have witnessed over the past few centuries. Consistent with economic theory, private money is information-sensitive and its issuers are prone to destabilizing bank runs. The same is true of privately produced digital money like stablecoins. When collateral backing privately produced money is not regulated—or simply do not exist—the fixed price of that money will not hold in times of stress. In that case, the quantities adjust to zero in a bank run. Yet the underlying assumption for the path forward is one of private money circulating alongside sovereign money.

Financial stability considerations were prominent in bringing about the sovereign’s monopoly over money in England, the United States, Canada, and Sweden. In England, there were hundreds of bank failures during the 18th and 19th centuries. In the United States, bank runs occurred frequently in the 19th century, before the establishment of the Federal Reserve and deposit insurance. In Canada, the central bank gained its monopoly because of a financial crisis. In Sweden, bank failures similarly led to the sovereign’s monopoly.

B. Legislative Options for Coexistence

Despite the potential concerns associated with financial stability and monetary sovereignty, every approach presently espoused by legislators and regulators is one of well-regulated coexistence. We discuss a few examples below to illustrate the point.

Senator Pat Toomey proposed the “Stablecoin Transparency of Reserves and Uniform Safe Transactions Act of 2022” or the “Stablecoin TRUST Act of 2022.”⁹⁴ Importantly, Senator Toomey’s idea would require the stablecoin issuer to back its coins with assets that satisfy the following conditions:

- (f) STABLECOIN RESERVES.—Payment stablecoins issued by a national limited payment stablecoin issuer shall be backed with assets—
 - (1) with a market value equal to not less than 100 percent of the par value of the payment stablecoins outstanding; and
 - (2) that are cash and cash equivalents or level 1 high-quality liquid assets denominated in United States dollars.⁹⁵

To be sure, this is a plus in terms of mitigating the runs on stablecoin issuers because holders of stablecoins would be assured that their coins were backed one-for-one. Moreover, Senator Toomey’s proposal would require the stablecoin issuer to publicly disclose its backing on a regular basis:

- (a) IN GENERAL.—Any person described in section 3(b) that issues a payment stablecoin shall—
 - (1) publicly disclose the assets backing the payment stablecoin on a monthly basis;
 - (2) adopt and publicly disclose policies for redeeming the payment stablecoin, including whether redemption requests will be met on demand or with a time lag;
 - (3) undergo quarterly attestations by a registered public accounting firm and publicly disclose the results; and
 - (4) attest that the assets backing the payment stablecoin do not materially diverge from those disclosed.⁹⁶

⁹⁴ See Stablecoin Transparency of Reserves and Uniform Safe Transactions Act, S.____, 117th Cong. (2022), https://www.banking.senate.gov/imo/media/doc/the_stablecoin_trust_act.pdf.

⁹⁵ *Id.* at §6.

⁹⁶ *Id.* at §4.

As another example, Senators Kirsten Gillibrand and Cynthia Lummis proposed the “Responsible Financial Innovation Act” in June 2022.⁹⁷ Similar to Senator Toomey’s proposal, the Gillibrand-Lummis proposal also requires the full, one-to-one backing of stablecoins and monthly disclosures of the backing assets.⁹⁸ Senator Bill Hagerty and Representative Trey Hollingsworth proposed their “Stablecoin Transparency Act,”⁹⁹ which covers the same set of issues.¹⁰⁰

To the best of our knowledge, there is no legislative proposal that questions coexistence.¹⁰¹ If members of Congress are not engaging in debates about coexistence and are accepting the premise—or desiring the outcome—that private money will coexist with sovereign money, then that assumption will most likely be reflected in the approaches by financial regulators on the ground.

Financial regulators are currently operating within the coexistence framework. For instance, the President’s Working Group stated: “To address risks to stablecoin users and guard against stablecoin runs, legislation should require stablecoin issuers to be insured depository institutions, which are subject to appropriate supervision and regulation, at the depository institution and the holding company level.”¹⁰² The Office of the Comptroller of the Currency has also taken preliminary steps to address the financial stability risks inherent in stablecoins,¹⁰³ but within the framework of coexistence.¹⁰⁴

Interestingly, it has been reported that the European Commission is considering a hard cap on stablecoin issuance. In particular, regulators could order the issuers of any stablecoin exceeding 200 million euros and 1 million transactions daily to cease

⁹⁷ Responsible Financial Innovation Act, S.4356, 117th Cong. (2022).

¹⁰² *Report, supra* note 4, at 2.

¹⁰³ See News Release, *OCC Clarifies Bank Authority to Engage in Certain Cryptocurrency Activities and Authority of OCC to Charter National Trust Banks* (Nov. 23, 2021), <https://www.occ.gov/news-issuances/news-releases/2021/nr-occ-2021-121.html> (“The Office of the Comptroller of the Currency (OCC) today published a letter confirming that national banks and federal savings associations must demonstrate that they have adequate controls in place before they can engage in certain cryptocurrency, distributed ledger, and stablecoin activities.”).

¹⁰⁴ Michael J. Hsu, *Thoughts on the Architecture of Stablecoins*, Remarks Before the Institute of International Economic Law at Georgetown University Law Center (Apr. 8, 2022), <https://occ.gov/news-issuances/speeches/2022/pub-speech-2022-37.pdf>.

issuances until these figures come back below the threshold. This effectively allows coexistence “up to a point” and no further.¹⁰⁵ Other than this report, however, most regulatory options—particularly in the United States—have established coexistence as the baseline.

C. Downsides of Coexistence

There are three important lessons for today’s lawmakers and financial regulators to learn from economic theory and the historical case studies. First, issuers of circulating private money are banks that are vulnerable to destabilizing bank runs. Second, because circulating private money competes against sovereign money, coexistence makes it more difficult to control the money supply and conduct monetary policy. Third, history teaches us that private money first circulated because the money supply was severely limited and there were no better alternatives.

The concern with respect to financial stability is well-understood. In every one of the case studies analyzed in the previous Part—England, the United States, Canada, and Sweden—financial stability concerns were front and center. In England, banks failed frequently—at least 343 bank failures between 1750 and 1830. During the U.S. National Banking Era, bank runs on deposits occurred frequently. In Canada, the monopoly coincided with the founding of the central bank, during a financial crisis. In Sweden, the Riksbank had to stand ready to intervene and there were still banking panics. This is not surprising. Consistent with economic theory, privately produced monies are information-sensitive and therefore prone to destabilizing bank runs. The same is true of privately produced digital money like stablecoins. We have recently seen stablecoins lose their pegs as market volatility increased.

To be sure, some have suggested transforming stablecoin issuers into “narrow banks,” thereby requiring each stablecoin to be backed by super-safe assets like central bank reserves or short-term U.S. Treasuries. Many of the legislative proposals lean in this direction. But doing so may result in unintended macroeconomic consequences.¹⁰⁶ In particular, uninsured holders of deposits at commercial banks might *run to the narrow stablecoin banks* in times of economic uncertainty. This would destabilize commercial banks.

¹⁰⁵ See Jack Schickler, *EU Commission Favors Ban on Large-Scale Stablecoins, Document Shows*, COINDESK (May 11, 2022), <https://www.coindesk.com/policy/2022/05/11/eu-commission-favors-ban-on-large-scale-stablecoins-document-shows/>.

¹⁰⁶ *Id.*

The concerns over the money supply are less appreciated. Countries in our case studies were naturally concerned with the money supply because it was a shortage of specie that led to the proliferation of privately produced monies in their economies. Again, to quote Paul Tucker, a British central banker, “[central banks] are able to implement monetary policy because the economy has a demand for central bank money and, as monopoly suppliers, [central banks] can set the terms on which [they] provide it.”

To see this point from a different angle, suppose a Big Tech firm issued a stablecoin. Current stablecoin issuers, which are new on the scene, have trouble convincing holders that they actually have reserves backing their coins one for one. Big Tech firms like Google, Apple, Facebook, and Microsoft, on the other hand, have significant resources and could be viewed as implicitly guaranteeing their stablecoins. This implicit guarantee could support a tremendous amount of stablecoins in circulation—a money supply that cannot be controlled by the central bank.

This is not merely a hypothetical. In June 2019, Facebook revealed plans to roll out in 2020 its own cryptocurrency, “Libra.”¹⁰⁷ Central banks around the world reacted with alarm.¹⁰⁸ Why? Central banks were not concerned because they were scared of financial stability consequences. Rather, they were concerned that an organization like Facebook—one that reaches *billions* of people around the world on a daily basis—would essentially become a competitor central bank. It could become the most powerful central bank on the planet.

In September 2019, the then-head of Facebook’s Libra program went on Twitter to assure central bankers on that point: “Recently there’s been a lot of talk about how

¹⁰⁷ Dirk A. Zetzsche, Ross P. Buckley & Douglas W. Arner, *Regulating LIBRA: The Transformative Potential of Facebook’s Cryptocurrency and Possible Regulatory Responses*, Oxford Journal of Legal Studies (forthcoming). Thibault Schrepel, *Libra: A Concentrate of “Blockchain Antitrust,”* 118 Mich. L. Rev. Online. 160 (2020).

¹⁰⁸ See, e.g., Danny Nelson, *CBDC Issuance Is ‘Not a Reaction’ to Libra, Says Central Bank Body*, CoinDesk (Jun. 25, 2020) (noting that “[i]n March 2019, three months before Facebook unveiled the Libra cryptocurrency, BIS chief Agustín Carstens said central banks ‘are not seeing the value’ of CBDCs. By July he had changed his tune, saying CBDC issuance might come ‘sooner than we think.’”); Robert Anzalone, *Central Banks Suddenly Woke Up When Facebook’s Libra Became A Reality*, Forbes (Oct. 3, 2019) (“Central banks suddenly woke up when Facebook’s Libra become a reality. Digital cash enthusiasts saw more headlines and more buzz on stablecoins as policy makers reacted to Libra. Central banks took serious notice, not just a passing fancy, on the prospect of competing digital cash vs fiat currency.”); Dirk Niepelt, *Libra Paves the Way for Central Bank Digital Currency*, VoxEU (Sep. 12, 2019) (observing that “[o]ld finance’ frets about the prospective new competitor; the FinTech sphere is buzzing with rumours; and regulators, central banks, and legislators alike are worried.”).

Libra could threaten the sovereignty of Nations when it comes to money. I wanted to take the opportunity to debunk that notion.”¹⁰⁹ Suffice it to say, central banks were not convinced. Facebook ended its private money experiment in early 2022.¹¹⁰

Finally, the most important lesson that lawmakers and financial regulators should learn is that private money circulated widely because *there were no better alternatives*. Recall that private bank notes began to circulate because of a shortage of sovereign money. During the U.S. Free Banking Era, for instance, the government did not print money and there was a shortage of coins, so private bank notes were used pervasively. Similarly, in Sweden, there was a very limited and stagnant circulation of metal coins as well as a limited supply of specie metal insufficient to provide the country with an adequate supply of generally accepted means of payments. There simply weren’t enough metal coins to go around, and that shortage was holding back economic development. Private banks filled the gap by issuing their own money, and the sovereigns permitted coexistence (for a time).

The shortage of money is not a problem in today’s world. Developed economies no longer rely on barter. In the previous two centuries, countries have established central banks and issued fiat currencies untethered to gold and silver. As long a country does not experience hyperinflation, its currency can successfully circulate.¹¹¹ However, the problems associated with the circulation of private money still persist.

To the extent that households and businesses around the world have a demand for private stablecoins, governments can step in to create a better alternative—digital money that satisfies the NQA principle, does not destabilize financial systems, and does not erode monetary sovereignty. We discuss such an approach next in Part V.

¹⁰⁹ David Marcus, Twitter (Sep. 16, 2019), <https://twitter.com/davidmarcus/status/1173566564576051200>.

¹¹⁰ See Hannah Murphy & Kiran Stacey, *Facebook Libra: The Inside Story of How the Company’s Cryptocurrency Dream Died*, Financial Times (Mar. 10, 2022); James Fontanella-Khan, Hannah Murphy & Miles Kruppa, *Facebook Gives Up on Crypto Ambitions with Diem Asset Sale*, Financial Times (Jan. 27, 2022).

¹¹¹ During such periods of hyperinflation, the government’s money is no longer credible and largely becomes worthless. Think of Germany in the 1920s, Zimbabwe in 2008, or Venezuela in 2019.

Part V. National Bank Act for the 21st Century

To date, all legislative proposals assume that having stablecoins circulate alongside sovereign money is the optimal path forward. No lawmaker is contemplating legislation akin to a 21st century version of the National Bank Act—the creation of better digital sovereign money paired with a deterrent on the adoption of private digital money. Such a carrot-and-stick approach could solve the problems identified by this article with respect to the proliferation of private stablecoins.

The carrot would be a central bank digital currency that could capture the benefits of private stablecoins—for example, reducing cross-border transaction costs—without the costs to financial stability and monetary sovereignty. The deterrent would take the form of a ban or a tax on stablecoins. To be sure, because of the transnational nature of stablecoins, having a U.S.-only deterrent would not be sufficient. (Enforcement would be very challenging.) Rather, it is meant to buy the government more time in developing its own digital currency by increasing the cost of using private stablecoins.

A. The Carrot: Developing Better Alternatives to Stablecoins

When private bank notes circulated in prior centuries, they did so because there were no better alternatives. Some may flag this issue now: Because there are no better digital money alternatives to stablecoins, simply regulating them or taxing them won't make them go away; stablecoins will immediately migrate to another jurisdiction without regulations or taxes and continue to circulate because of existing market demand. With this in mind, we first and foremost propose a carrot: a sovereign alternative that does not have the downsides of private digital money. This sovereign version is oftentimes referred to as a central bank digital currency.¹¹²

In general, a central bank digital currency is “defined as a digital liability of a central bank that is widely available to the general public. In this respect, it is analogous to

¹¹² See Gary B. Gorton & Jeffery Y. Zhang, *The Orkney Slew and Central Bank Digital Currencies*, HARVARD NATIONAL SECURITY JOURNAL (forthcoming) (providing an in-depth treatment of central bank digital currencies, including their impact on cross-border trade and national security). For a discussion of sovereign alternatives that do not involve central bank digital currencies, see Howell E. Jackson & Timothy G. Massad, *The Treasury Option: How the U.S. Can Achieve the Financial Inclusion Benefits of a CBDC Now*, BROOKINGS REPORT (2022) (writing that the Treasury Department could quickly create digital accounts to expand access to payment services); Peter Conti-Brown & David A. Wishnick, *Private Markets, Public Options, and the Payment System*, 37 YALE J. ON REG. 380 (2020) (arguing that the Federal Reserve's FedNow payment platform can “catalyze innovation, enhance access to developing payment networks, and shore up financial stability”).

a digital form of paper money.”¹¹³ (Today, cash is the only central bank liability that is available to the public.) This is the key difference between a stablecoin and a central bank digital currency: the latter would be a liability of the central bank and not the liability of a private entity issuer. And, because it would be a liability of the central bank, it would not have the same financial stability risks inherent to private money and it would preserve monetary sovereignty.

In addition, a central bank digital currency also could improve payments system. According to a white paper published by the Federal Reserve, “[a central bank digital currency] could provide households and businesses a convenient, electronic form of central bank money, with the safety and liquidity that would entail; give entrepreneurs a platform on which to create new financial products and services; support faster and cheaper payments (including cross-border payments); and expand consumer access to the financial system.”¹¹⁴

Notably, countries around the world are actively pushing ahead with the research and development of central bank digital currencies. According to a survey of central banks conducted by the Bank for International Settlements, 86 percent of central banks are actively researching the potential for central bank digital currencies, 60 percent are experimenting with the technology, and 14 percent are deploying pilot projects.¹¹⁵

From an administrative law perspective, the Federal Reserve has rejected the idea of expanding access to Federal Reserve Accounts as a particular design option for a central bank digital currency: “The Federal Reserve Act does not authorize direct Federal Reserve accounts for individuals, and such accounts would represent a significant expansion of the Federal Reserve’s role in the financial system and the economy.”¹¹⁶ However, we are not arguing for account-based digital money but rather for token-based digital money, as shown in the table below. We are not advocating for the general public to be given accounts at the central bank but are instead advocating for the general public to be given the digital equivalent of Federal Reserve Notes (*i.e.*, digital cash).

¹¹³ Board of Governors of the Federal Reserve System, *Money and Payments: The U.S. Dollar in the Age of Digital Transformation* (Jan. 2022).

Table 4: Examples of Different Types of Money

	Private Money	Sovereign Money
Token-Based Money	Stablecoins	Federal Reserve Notes CBDC (Digital Cash)
Account-Based Money		CBDC (Digital Accounts)

Indeed, there are two ways to think about designing a central bank digital currency. The first is an indirect model in which the consumer has a claim on an intermediary (e.g., a bank), with the central bank keeping track of the accounts. The second is a direct model in which the consumer has a direct claim on the central bank, which keeps a record of every transaction. We favor the first proposal, under which a central bank digital currency would be issued as a digital version of physical cash. Thus, if you were to withdraw \$50 from your bank account, you could choose the \$50 to be withdrawn either in the form of digital cash (on your phone or in your digital wallet) or physical cash. This is the most straightforward option and the least likely to cause unintended consequences.

If the central bank digital currency were not designed properly, it could disintermediate the existing financial institutions and cause greater financial instability. For instance, in times of economic crises, depositors typically run on banks because they perceive those banks to be risky. Having a central bank digital currency as an alternative may exacerbate those bank runs because depositors know that “central bank money is the safest form of money.”¹¹⁷ The sudden substitution toward liabilities of the Federal Reserve could further destabilize the banking system during a panic. To counter this potential financial stability issue, the Federal Reserve could pay zero interest on a central bank digital currency, limit the total amount of a central bank digital currency held by a user, or limit the amount of a central bank digital currency that a user can accumulate over a short time period.¹¹⁸

B. The Stick: Deterring the Adoption of Stablecoins

Producing a central bank digital currency—the carrot—to compete against private stablecoins is the most important piece of our proposal. There is a market demand for

¹¹⁷ *Id.* at 17.

¹¹⁸ *Id.* at 18.

private money, and it takes a product to beat a product. Recall that, in prior centuries, private money circulated because there was no better alternative. Central bank digital currencies could be a better product than private stablecoins if designed properly and used in cross-border transactions.

The carrot, however, could use some help. There are two reasons why it is important to pair a stick with the carrot. The first is that it will take time—likely many years—for the Federal Reserve and other central banks to create sovereign digital currencies that are interoperable. Private stablecoins are likely to fill the void in the meantime because there are no alternatives. To slow down adoption in this interim period, the government could increase the marginal cost of using stablecoins as a means of payment. It buys the Federal Reserve more time. Second, history shows us that, even if a sovereign alternative is present, it might be difficult for it to outcompete private money once the private money has been widely used and entrenched. Old habits are hard to break. The U.S. case study shows that Congress had to implement a tax on bank notes to incentivize the uptake of the new national currency that was created in 1863.

In the following subsections, we explore two options for Congress to increase the cost of using stablecoins. The first is an outright ban on stablecoins. The second is a tax on stablecoins. Both would come about through new legislation.

1. Banning Stablecoins

If coexistence is such a bad idea, why not just ban stablecoins? Congress has banned products and services in the past, so why not add stablecoins to that list? One practical reason against imposing a ban is that stablecoins operate across jurisdictions. Stablecoins circulate via digital wallets on the blockchain. They are not stored—or do not have to be stored—in accounts. Enforcement of such a complete ban would be impossible at worst and a nightmare at best, hence the “carrot” part of our proposal. Another practical reason is that, from a political perspective, it’s clear that Congress has little appetite to ban stablecoins outright. As noted above, every single piece of proposed legislation assumes coexistence.

Of course, Congress is well within its constitutional limits to ban on stablecoins under the Commerce Clause.¹¹⁹ In *Gonzales v. Raich*,¹²⁰ the U.S. Supreme Court asserted: “First, Congress can regulate the channels of interstate commerce.... Second, Congress has authority to regulate and protect the instrumentalities of interstate

¹¹⁹ U.S. CONST. art. 1, § 8, cl. 3.

¹²⁰ 545 U.S. 1 (2005).

commerce, and persons or things in interstate commerce... Third, Congress has the power to regulate activities that substantially affect interstate commerce.” In that case, a couple of California residents argued that the federal ban on growing marijuana for personal use exceeded the powers of Congress under the Commerce Clause. The Court disagreed, even though the marijuana grown by the California residents were neither sold nor transported across state lines. Suffice it to say, the Court’s broad interpretation of the Commerce Clause could sustain a ban on stablecoins. Even a narrower interpretation would likely sustain a ban on stablecoins given that stablecoins could be used as money to settle transactions in interstate commerce.

2. Taxing Stablecoins

A more politically feasible deterrent against stablecoin adoption is for Congress to tax stablecoins. There is legislative precedent for a tax on the circulation of private money. Recall from Part II that Congress passed the National Bank Act in 1863 to help finance the Civil War by creating national banks to issue a uniform national currency. Uptake of the new currency was not immediate, as many individuals and businesses stayed with using private state bank notes (*i.e.*, the stablecoins of the 19th century). Congress subsequently passed legislation in 1865 that required all banks to pay a 10 percent tax on payments that they made in currency other than the national currency:

SEC. 6. *And be it further enacted*, That every national banking association, state bank, or state banking association shall pay a tax of ten per centum on the amount of notes of any state bank or state banking association, paid out by them after the first day of July, eighteen hundred and sixty-six.¹²¹

The constitutionality of the tax came before the Supreme Court in *Veazie Bank v. Fenno* (1869), a case brought by a state-chartered bank in Maine that issued its own private bank notes subject to the tax. The bank refused to pay the 10-percent tax, alleging it to be unconstitutional. The Supreme Court upheld the tax.

Through the mid 1870s, Congress repeatedly passed legislation to tax the circulation of private money. Congress even expanded the scope of the tax along multiple dimensions. The original version of the tax, passed in 1865, applied only to private state bank notes issued by banks. In 1866, the tax was expanded to cover private notes issued by state banks or any persons.¹²² The following year, the tax was expanded to

¹²¹ Ch. 78, § 6, 13 Stat. 469, 484 (1865).

¹²² Ch. 184, § 9[bis], 14 Stat. 98, 146 (1866).

cover notes issued by towns, cities, and municipal corporations.¹²³ By 1875, the tax on private money circulation had two parts¹²⁴:

SEC. 19. That every person, firm, association other than national bank associations, and every corporation, State bank, or State banking association, shall pay a tax of ten per centum on the amount of *their own notes* used for circulation and paid out by them.

SEC. 20. That every such person, firm, association, corporation, State bank, or State banking association, and also every national banking association, shall pay a like tax of ten per centum on the amount of *notes of any person, firm, association other than a national banking association, or of any corporation, State bank, or State banking association, or of any town, city, or municipal corporation*, used for circulation and paid out by them.

The circulation tax applied to one's own privately issued money as well as to the privately issued money of others. Congress designed the coverage to be very broad. To give you an idea of the breadth of the circulation tax, even private clearinghouses¹²⁵ and mining companies in Michigan's Upper Peninsula¹²⁶ had to ask for exemptions.

This tax on circulating private money stayed “on the books” for over a century, until 1976. (Table A2 in the Appendix includes a timeline that illustrates the full evolution of the tax.) Why did Congress eventually repeal the tax? Was it because Congress suddenly wished for private money to circulate alongside sovereign money? No. It was

¹²³ Ch. 8, § 2, 15 Stat. 6 (1867).

¹²⁴ 18 Stat. 307, 311 (1875) (emphasis added).

¹²⁵ During banking panics in the National Bank Era—1863 to 1914—banks suspended convertibility and clearinghouse “certificates” were used to pay balances between respective banks. In smaller communities, these certificates were even circulated as money. Because of the financial instability, the Comptroller of the Currency and the Secretary of the Treasury “winked at this violation of law and permitted the banks the use of this unusual currency until normal times were restored.” Subsequently, the U.S. Attorney General and courts ruled that the tax on private money circulation did not apply to clearinghouse loan certificates. Gary B. Gorton, *MISUNDERSTANDING FINANCIAL CRISES: WHY WE DON'T SEE THEM COMING* (2012) at 98-101.

¹²⁶ The Revised Statutes of 1875 also included section 3408, which imposed a 1/12 percent monthly tax on “the average amount of circulation issued by any bank, association, corporation, company, or person.” Originally, there were no banks that operated in the mining area of Michigan's Upper Peninsula. Mining companies paid their laborers by giving them “drafts” that could be converted into money once they were “transmitted east for payment.” Not surprisingly, these drafts eventually circulated as money in the remote mining areas—in violation of section 3408. Moreover, banks that accepted drafts were in violation of the 10 percent tax. See Report from the Committee on Ways and Means, *Taxes in the Sixth Collection District of Michigan* (Feb. 22, 1875).

because Congress wanted to streamline the Internal Revenue Code and thought this particular tax provision was pointless.

Specifically, the repeal of the circulation tax in the Tax Reform Act of 1976 was part of the “deadwood” section of the act, repealing several sections which no longer had any application. A deadwood bill was first introduced in 1970 “to simplify the Internal Revenue Code of 1954 by repealing provisions which are obsolete or are unimportant and rarely used.”¹²⁷ The bill was 174 pages long and included a repeal of the circulation tax,¹²⁸ among many other amendments to the tax code. That bill died in committee and was reintroduced in 1971.¹²⁹ This version also died in committee, but the staff of the Joint Committee on Internal Revenue Taxation produced a section-by-section explanation of the bill. With respect to the circulation tax, committee staff stated: “Subsection (c) repeals provisions relating to circulation of other than national banks. The Comptroller of the Currency has stated that . . . these provisions are not needed for effective enforcement. *No tax is collected under these provisions.*”¹³⁰ In other words, there was no private money in circulation for the government to tax. There hadn’t been for nearly a century. This provision was utterly useless.

H.R. 92-25 was incorporated into H.R. 94-10612 as Title XIX, “Repeal and Revision of Obsolete, Rarely Used, Etc. Provisions,” which became the 1976 Tax Reform Act.¹³¹ Few changes were made to the deadwood provisions, and the 1971 explanation by committee staff was reprinted to accompany the new version with just a short paragraph added to explain the differences. The section repealing the circulation tax was unchanged as the bill moved through Congress, and the House and Senate committee reports on the bill used the same language (“The Comptroller of the

¹³¹ Pub. L. 94-455.

Currency has stated...”) to justify that section.¹³² The bill was signed into law on October 4, 1976.¹³³

Nothing in the legislative history suggests that Congress consciously decided to erode the sovereign’s monopoly on issuing circulating money. Congress repealed the tax on private money circulation because it was *so obvious* that coexistence was a dead issue—deadwood, to be precise. Who could have imagined that, in the 21st century, entrepreneurs would attempt to reinvent digital versions of the private bank notes that circulated during the 19th century.

However, one issue to consider is that Congress imposing a 10 percent tax today might be more constitutionally fraught than it was in the late 1800s. In *Bailey v. Drexel Furniture Co.*,¹³⁴ the U.S. Supreme Court held that a tax “which clearly, on its face, is designed to penalize, and thereby to discourage or suppress, conduct the regulation of which is reserved by the Constitution exclusively to the States, cannot be sustained under the federal taxing power by calling the penalty a tax.”¹³⁵ But there are two countervailing considerations. The first is that the issuance of money—and its regulation—is not reserved by the Constitution exclusively to the States. The Coinage Clause makes that apparent. Second, in *Bailey*, the Court explicitly distinguishes its holding from that in *Veazie Bank v. Fenno*:

It will be observed that the sole objection to the tax [on private note circulation in *Veazie*] there was its excessive character. Nothing else appeared on the face of the act. It was an increase of a tax admittedly legal to a higher rate, and that was all. There were no elaborate specifications on the face of the act, as here, indicating the purpose to regulate matters of state concern and jurisdiction through an

¹³² In general, the Joint Committee on Internal Revenue Taxation justified the deadwood provisions in this manner: “This bill, which has been developed over a number of years represents an attempt to simplify the tax laws by removing from the code those provisions which either are no longer used at all in computing current taxes or are little used and are of minor importance. It has been popularly referred to as the ‘deadwood’ bill... The provisions deleted include those which deal only with past years, situations which were initially narrowly defined and are unlikely to reoccur, as well as provisions which have largely, if not entirely, outlived their usefulness.” Congress should have consulted a monetary economist first.

¹³³ To be sure, there were congressional challenges to the tax in the 19th century. Table A3 in the Appendix contains a non-exhaustive list. It appears that the repeal effort peaked in 1894, with several days of debate on a repeal bill. The Democratic Party also made repeal of the tax on state bank notes a part of its platform in 1892, although it was not in the party’s next platform in 1896. See The American President Project, UC Santa Barbara <https://www.presidency.ucsb.edu/people/other/democratic-party-platforms>.

¹³⁴ 259 U.S. 20 (1922).

¹³⁵ *Id.* at 20.

exaction so applied as to give it the qualities of a penalty for violation of law, rather than a tax.¹³⁶

In other words, *Veazie* is still on solid ground and Congress is within its constitutional limits to tax circulating private money.

¹³⁶ *Id.* at 41.

Conclusion

Cryptocurrencies transformed from a market measured in pennies into one worth over a trillion dollars in the span of a decade. Stablecoins, a subset of cryptocurrencies designed to circulate like digital cash, are now gaining a greater foothold inside and outside of the cryptocurrency ecosystem. While the technology of money creation has changed tremendously, the underlying economic principles have not. Credible money is information-insensitive, trades at par, and supports trillions of economic transactions. It is not subject to bank runs. Economic theory and financial history teach us that the government can provide such information-insensitive money. The question before us is whether the government should be the *only* entity to provide such money. This is the question of “coexistence.”

We observe that the only times when private money has circulated successfully occurred (a) in *limited* geographical areas and (b) were backed by *unlimited* liability. In other words, if Jeff Bezos, Elon Musk, Bill Gates, Mark Zuckerberg, and Warren Buffet—with a combined net worth of \$762 billion¹³⁷—decided to issue a private currency that (a) only circulated in a confined ecosystem and (b) were backed by unlimited liability against their personal assets, that privately issued currency would probably succeed. Without those conditions, however, only the government can credibly create money for mass circulation. And, in doing so, the government preserves financial stability and monetary sovereignty.

Today, Congress faces the coexistence decision with stablecoins. Lawmakers believe that coexistence is the optimal path forward and are crafting legal guardrails under that assumption. But it is imperative to take a step back and be careful not to resurrect the system of coexistence that was declared dead for good reasons in the 19th and 20th centuries.

Appendix

During the 19th and 20th centuries, every country decided that the production of circulating money would be a monopoly given to the sovereign, particularly to the country's central bank. Table A1 presents some notable examples.¹³⁸

¹⁴⁵ Internal Revenue Code of 1939, § 1900(b), 53 Stat. 1, 207.

of any person, firm, association other than a national banking association, or of any corporation, State bank, or State banking association, or of any town, city, or municipal corporation, used for circulation and paid out by them.”

The language appears in the Internal Revenue Code, and is unchanged from its earlier version.¹⁴⁶

§ 4881(b)(1): “Every person, firm, association other than national bank associations, and every corporation, State bank, or State banking association, shall pay a tax of 10 percent on the amount of their own notes used for circulation and paid out by them.”

1954

§ 4881(b)(2): “Every such person, firm, association, corporation, State bank, or State banking association, and also every national banking association, shall pay a like tax of 10 per cent on the amount of notes of any person, firm, association other than a national banking association, or of any corporation, State bank, or State banking association, or of any town, city, or municipal corporation, used for circulation and paid out by them.”

Congress repeals §§ 4881-4886 of the 1954 Internal Revenue Code.¹⁴⁷

1976

§ 1904(a)(18): “Subchapter E of chapter 39 (relating to tax on circulation other than of national banks) is repealed.”

¹⁴⁶ Internal Revenue Code of 1954, § 4881(b), 68A Stat. 1, 587.

¹⁴⁷ Tax Reform Act of 1976, Pub. L. 94-455 § 1904(a)(18), 90 Stat. 1520, 1814.

Table A3: Attempted Repeals of the Circulation Tax

Year	Description
1877	H.R. 45-229 referred to House Committee on Ways and Means and not reported. Rep. Vance briefly spoke on the bill on May 1, 1878. 7 Cong. Rec. 3068-72.
1883	H.R. 48-1441 & 1459 referred to the House Committees on Banking and Currency (1441) and Ways and Means (1459) and not reported.
1888	H.R. 50-1816 & 50-6660 referred to House Committee on Banking and Currency and reported adversely. Never debated or voted on in House.
1892	H. R. 52-3964 & 9344 referred to House Committee on Ways and Means and not reported.
1892	S. 52-2133 referred to the Senate Committee on Finance and reported adversely. Never debated or voted on in Senate.
1893	H.R. 53-4016 was sent to the House Committee on Banking and Currency and never reported out.
1893	H.R. 53-136 was sent to the House Committee on Banking and Currency and never reported out, but there was one September 29, 1893, hearing at which it was discussed extensively.
1893	H.R. 53-3825 would have exempted clearinghouse certificates and similar notes issued between August 1 and October 15, 1893, from the tax. Reported favorably by the House Committee on Banking and Currency, with a brief explanation of the bill; also mentioned during the September 29, 1893, hearing, on page 237. When the bill was reported in the House, Rep. Cox immediately offered an amendment that would repeal the tax altogether.
